Proxenos

a private twin that drafts your next step

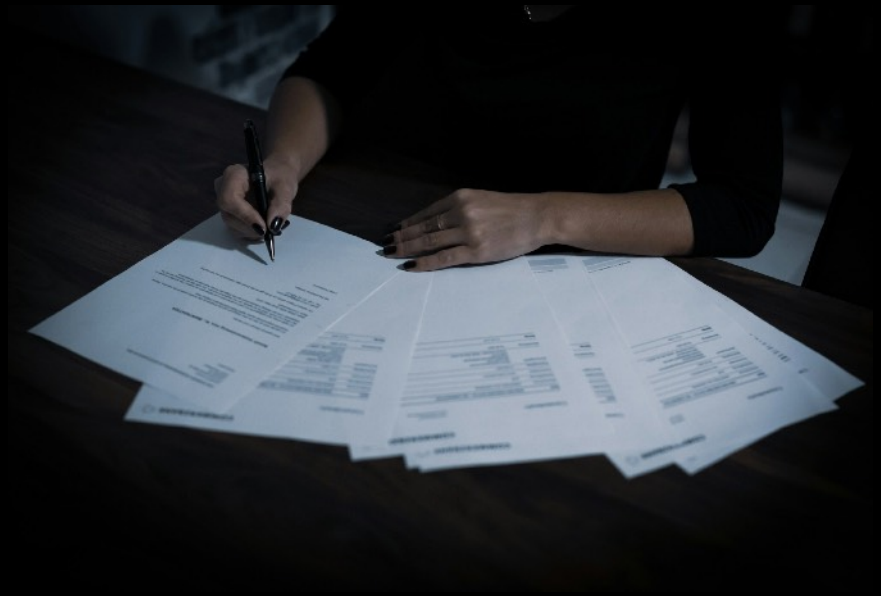

Mrugank Dake

mindemory.io/proxenos

You get sick.

The care is the easy part.

Then come the calls, bills, forms and referrals.

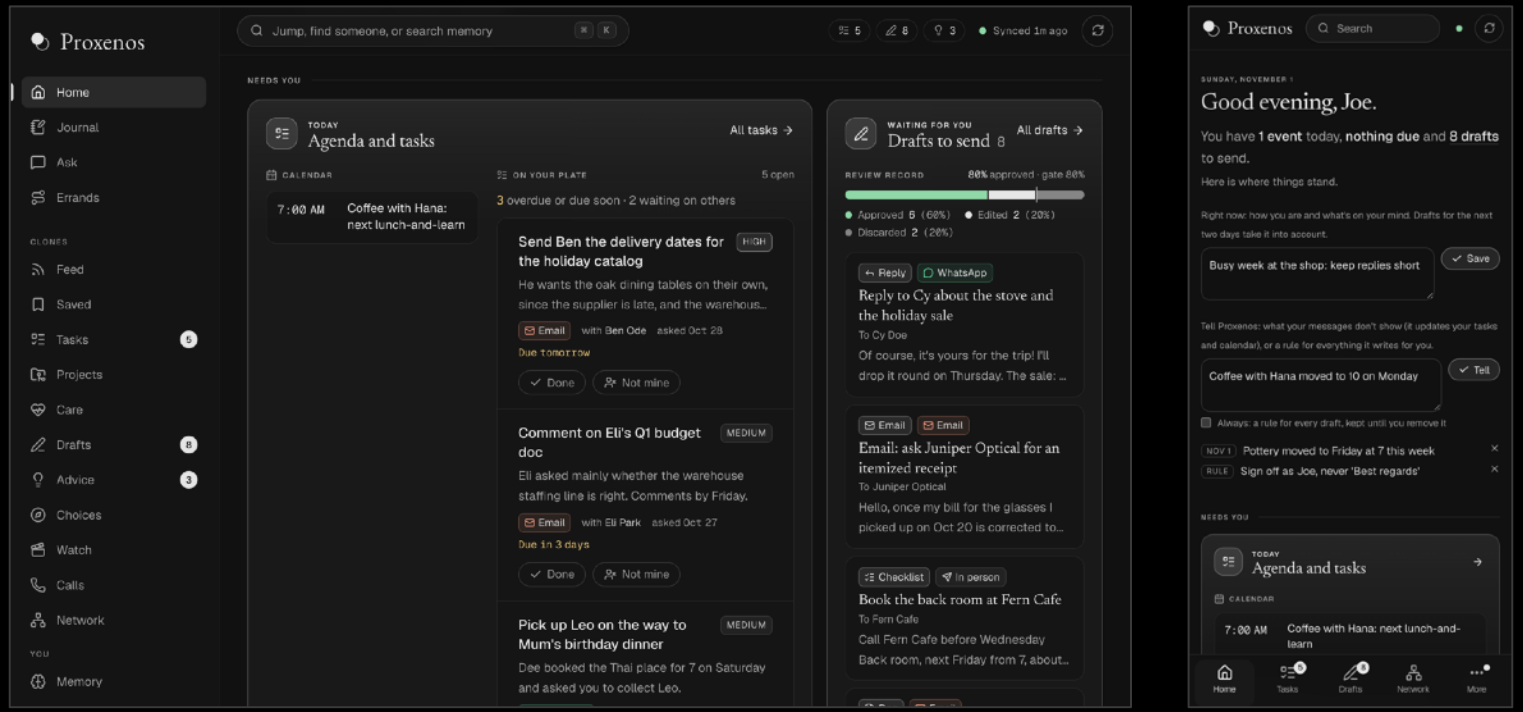

all of it on you, on your worst days

Sick or not,

too many threads, and one of you.

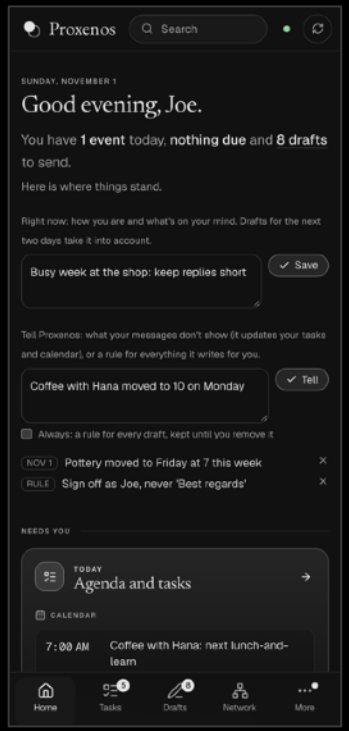

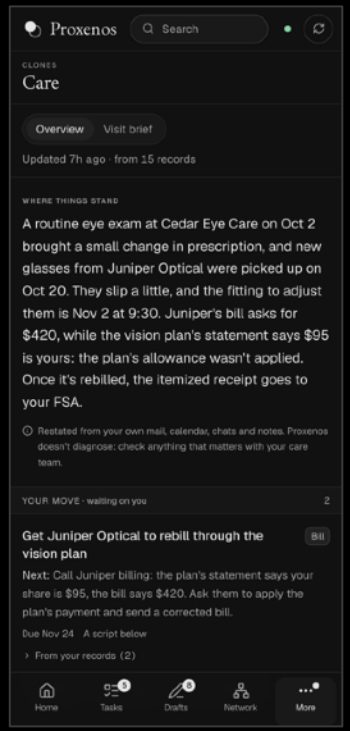

Meet Proxenos

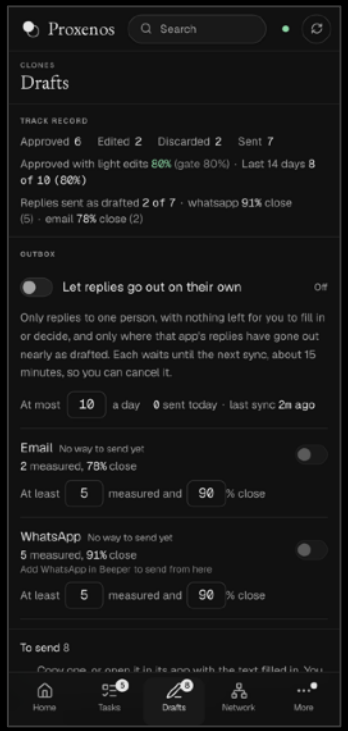

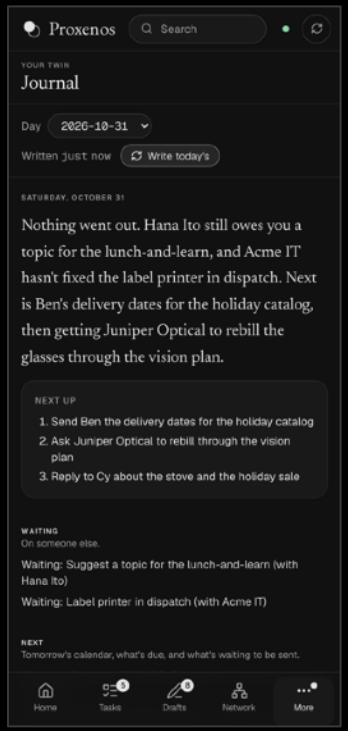

it keeps track, and drafts the next step · you press send

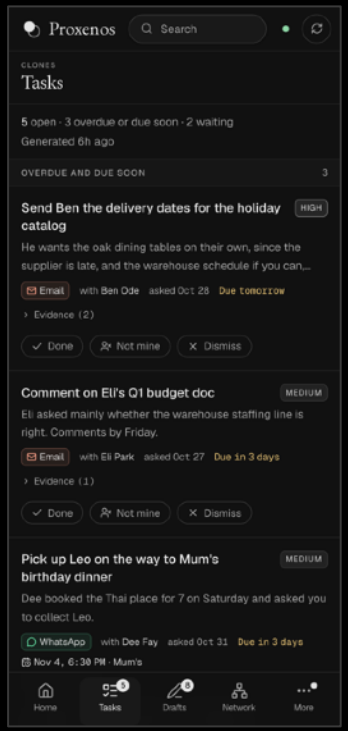

On your phone, too

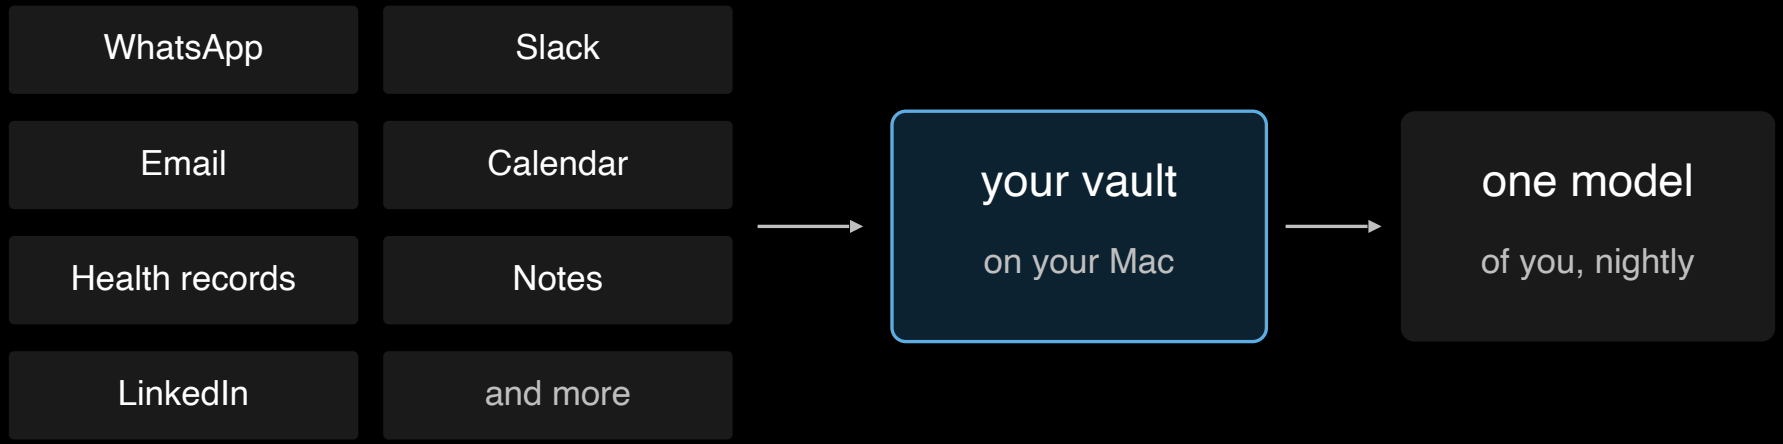

It starts with what you already have

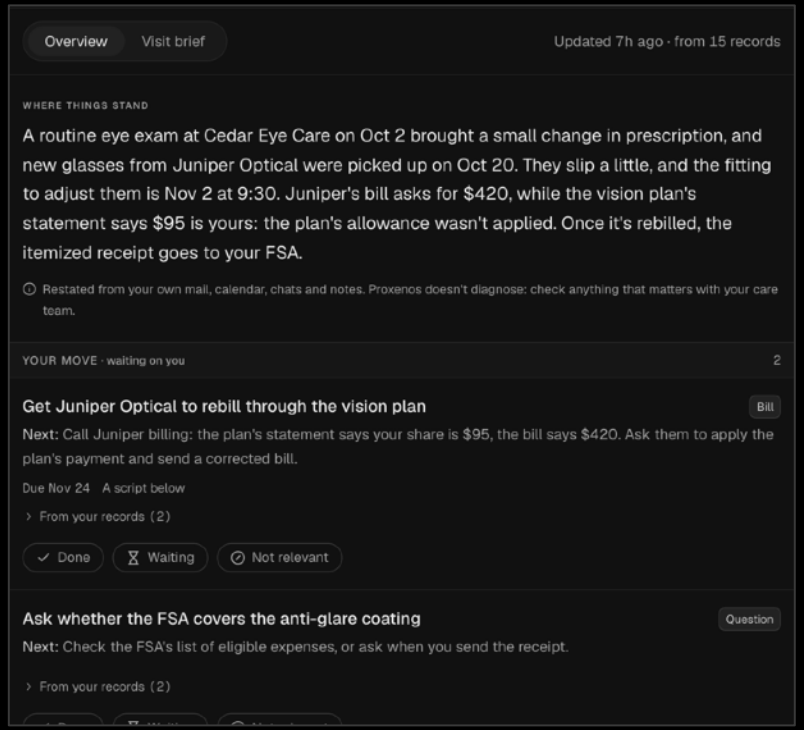

a local model by default: nothing has to leave the Mac

What it reads

WhatsApp	Slack	Gmail, any IMAP	Microsoft 365
Google Calendar	Apple Mail, Calendar	Health records (FHIR)	Drive, Keep, Tasks
Strava	Spotify	LinkedIn, X	Instagram, Messenger
Bluesky	Notion, Obsidian	PDFs, documents	Letterboxd
ChatGPT, Claude	your site, your papers	YouTube, Chrome	and more

each source works on its own · re-running one is always safe

Joe's bill says $420. His plan says $95.

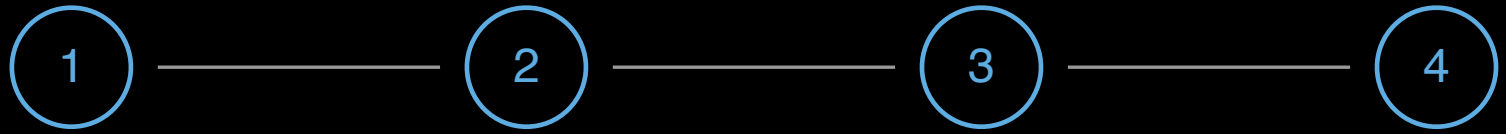

- where things stand
- what's his to do
- what to say on the phone
- a brief for the next visit

restates his records · never diagnoses

Joe and his records are made up

So it makes the call

dials
through Joe's own Twilio

waits on hold
in silence

says what it is
an automated assistant

rings Joe
when a person answers

or it asks for what the call sheet lists

it never agrees to pay

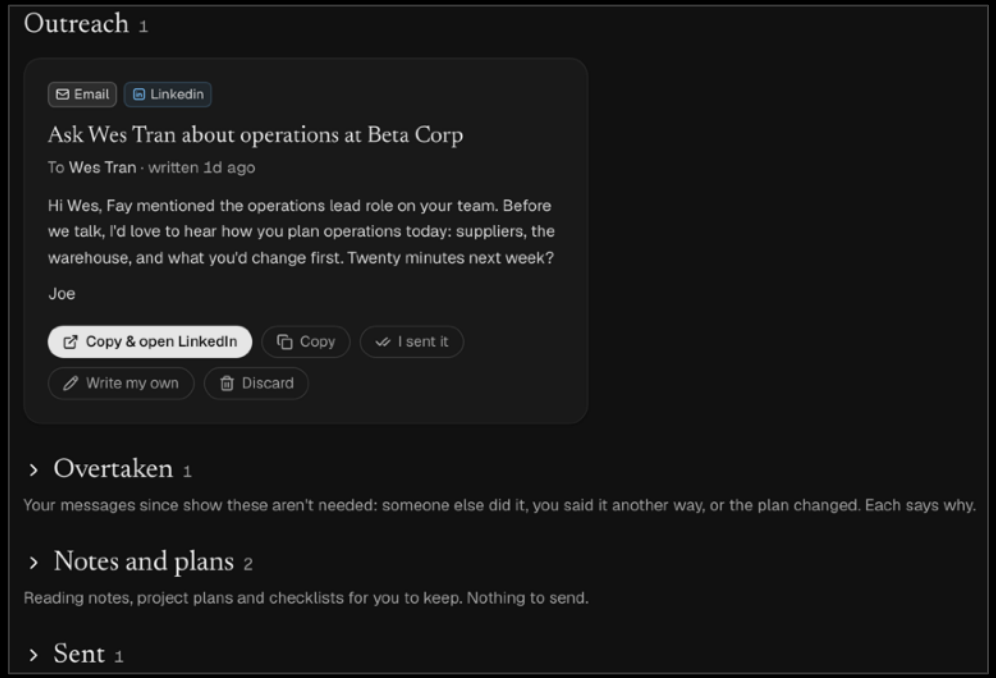

It fills the form from his records

intake-form.pdf

Name	Joe Bloggs	●
Address	14 Birch Lane	●
Date of visit	Oct 20	●
Vision plan	Brightline	●
SSN	left for Joe	○
Member ID	left for Joe	○
Signature	Joe's own	○

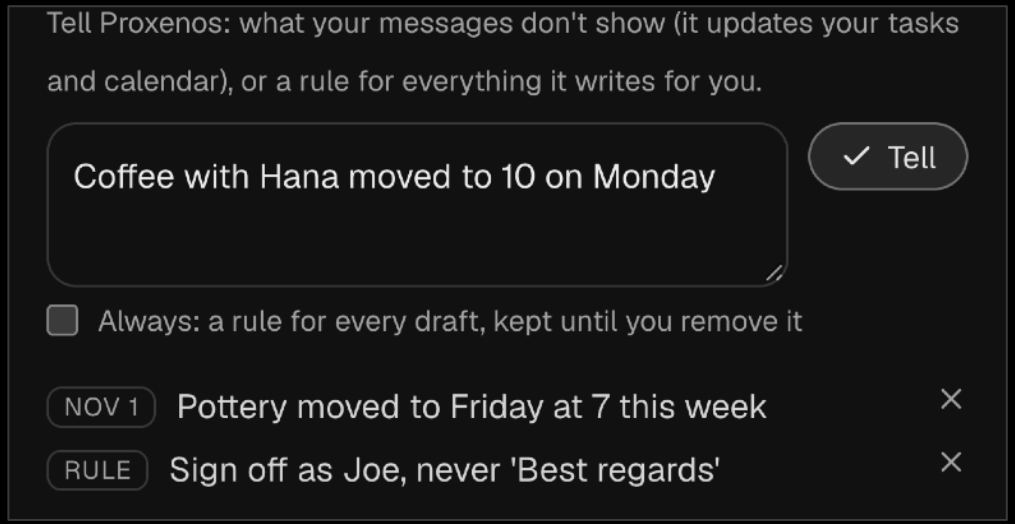

- filled from his records
- sources for every answer
- never IDs, account numbers or signatures

Every chat gets a reply in his voice

- his voice, per person
- learns from what he sent
- and from what he rewrote
- overtaken drafts fold away

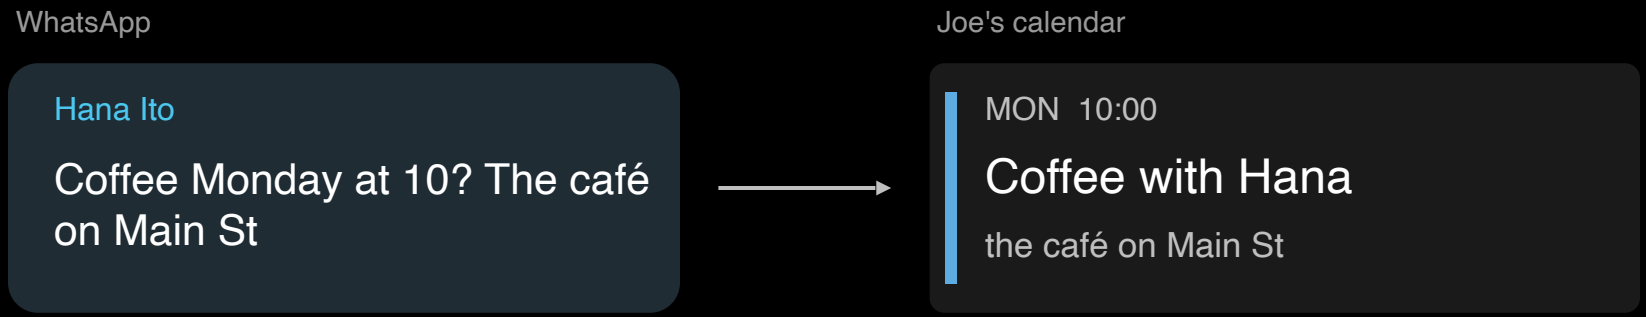

He tells it what messages don't show

fact — for now: tasks and calendar follow

rule — always: every draft keeps it

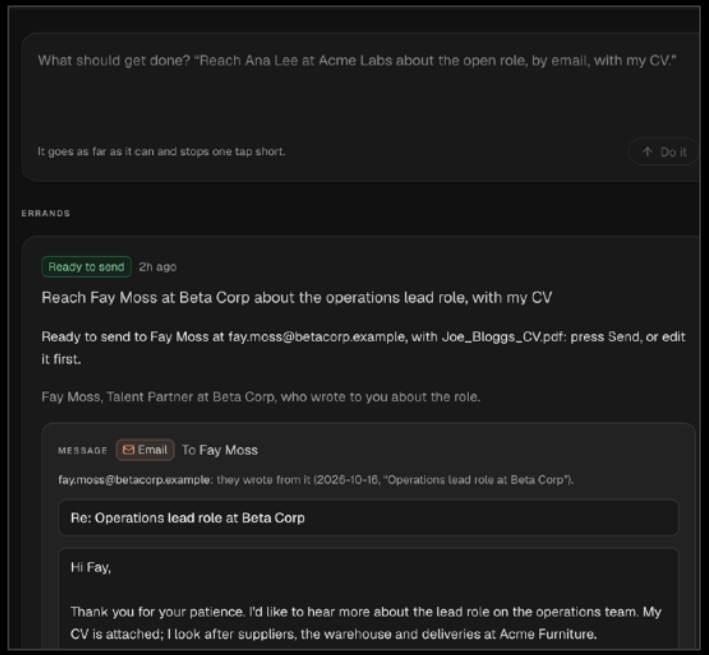

Plans land on his calendar

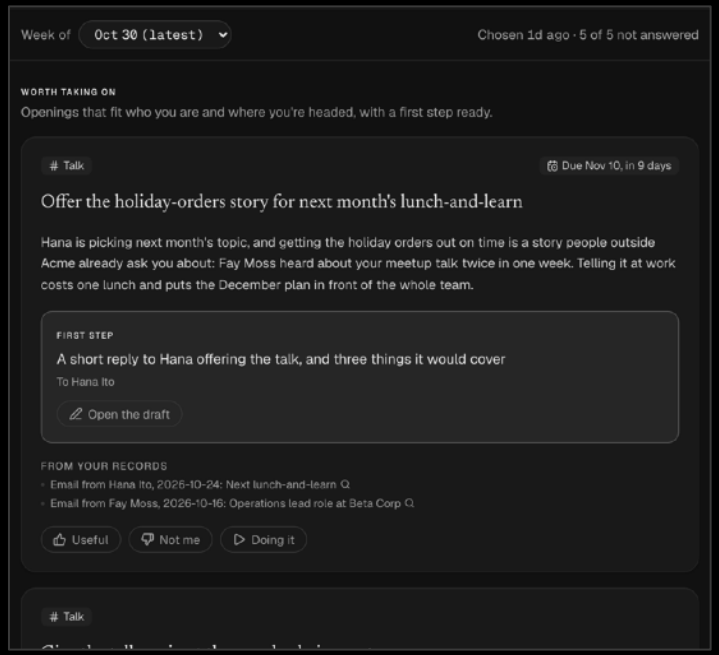

from any chat or email, to his own calendar

only the events Proxenos made are ever changed

It runs his errands, and weighs his week

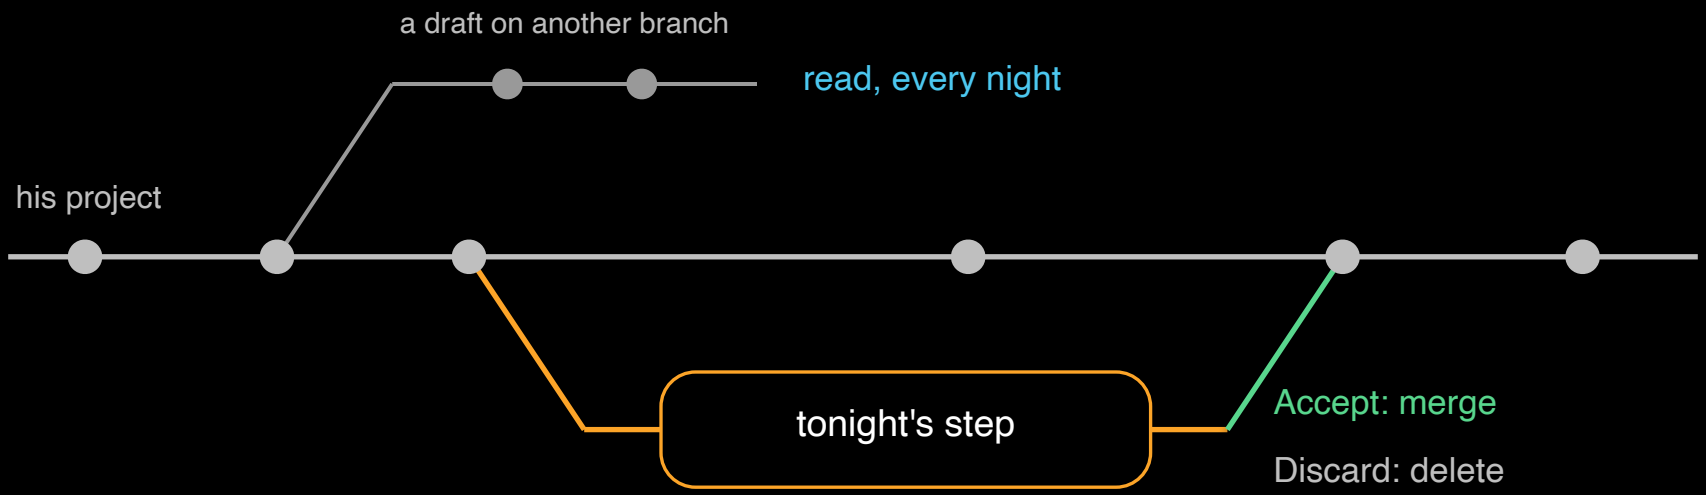

errands: done up to one tap short of send

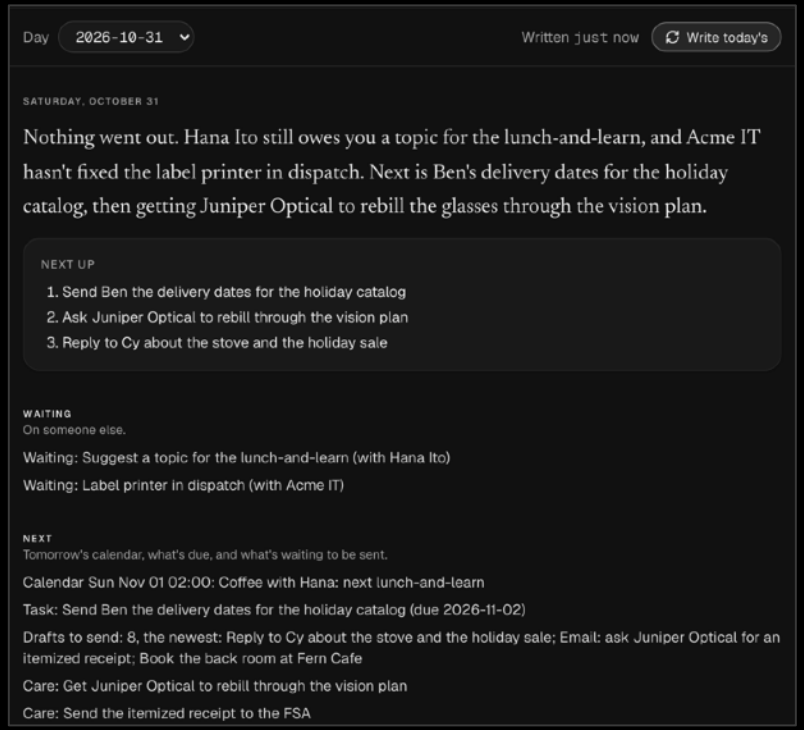

choices: what to take on, what to let go

His projects move while he sleeps

an analysis, a fix, a figure, a section · its own branch · nothing pushed

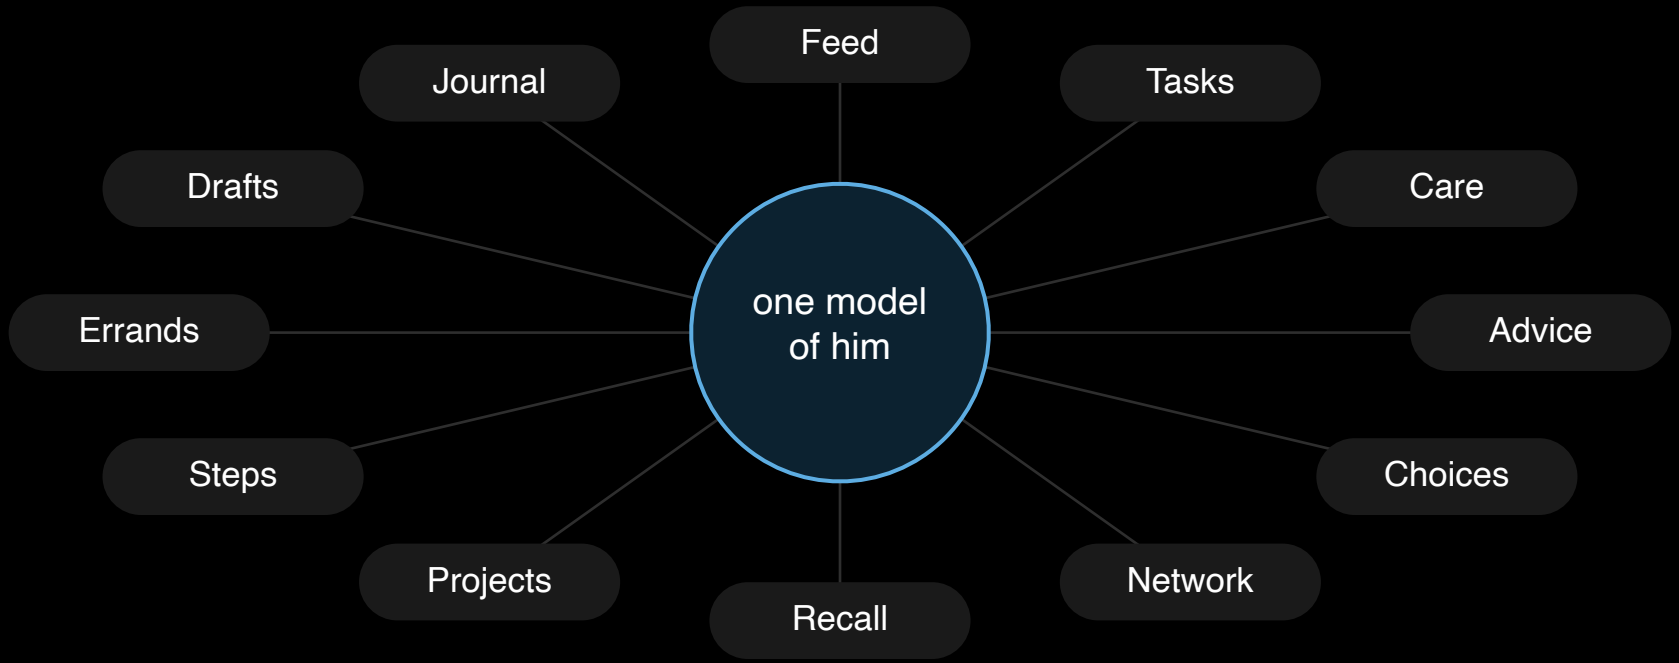

Each day, written down

- done
- said
- moved
- waiting
- next

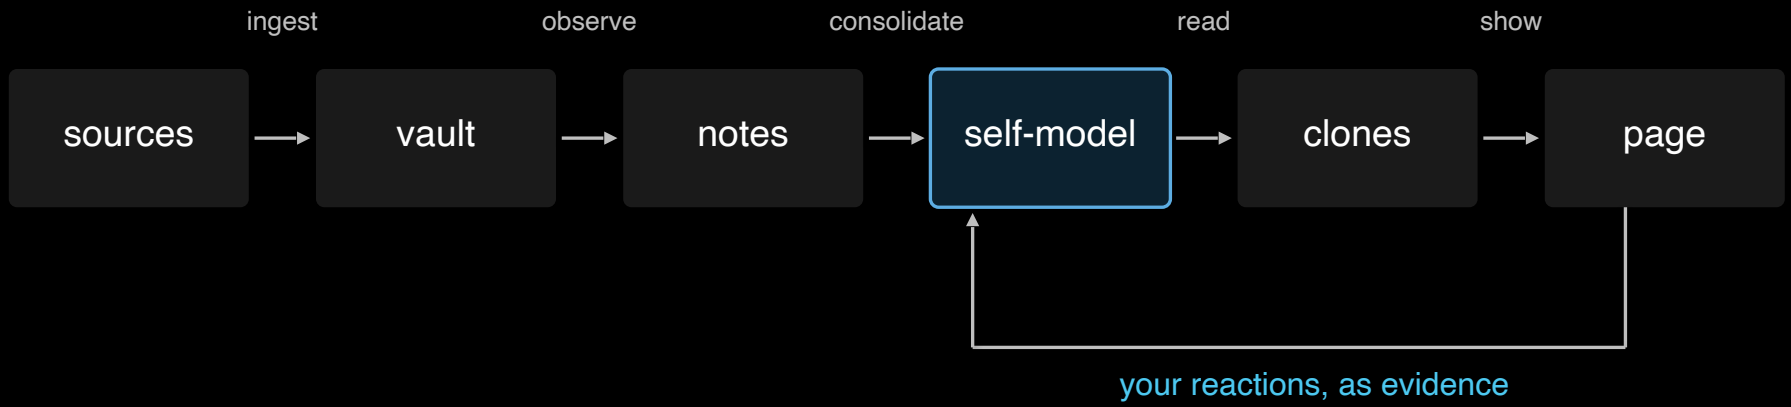

written each night, or when he asks

One model of him, many clones

each clone does one job · only his own behavior counts as evidence

How it works

each night: sync, notes, self-model, then every clone

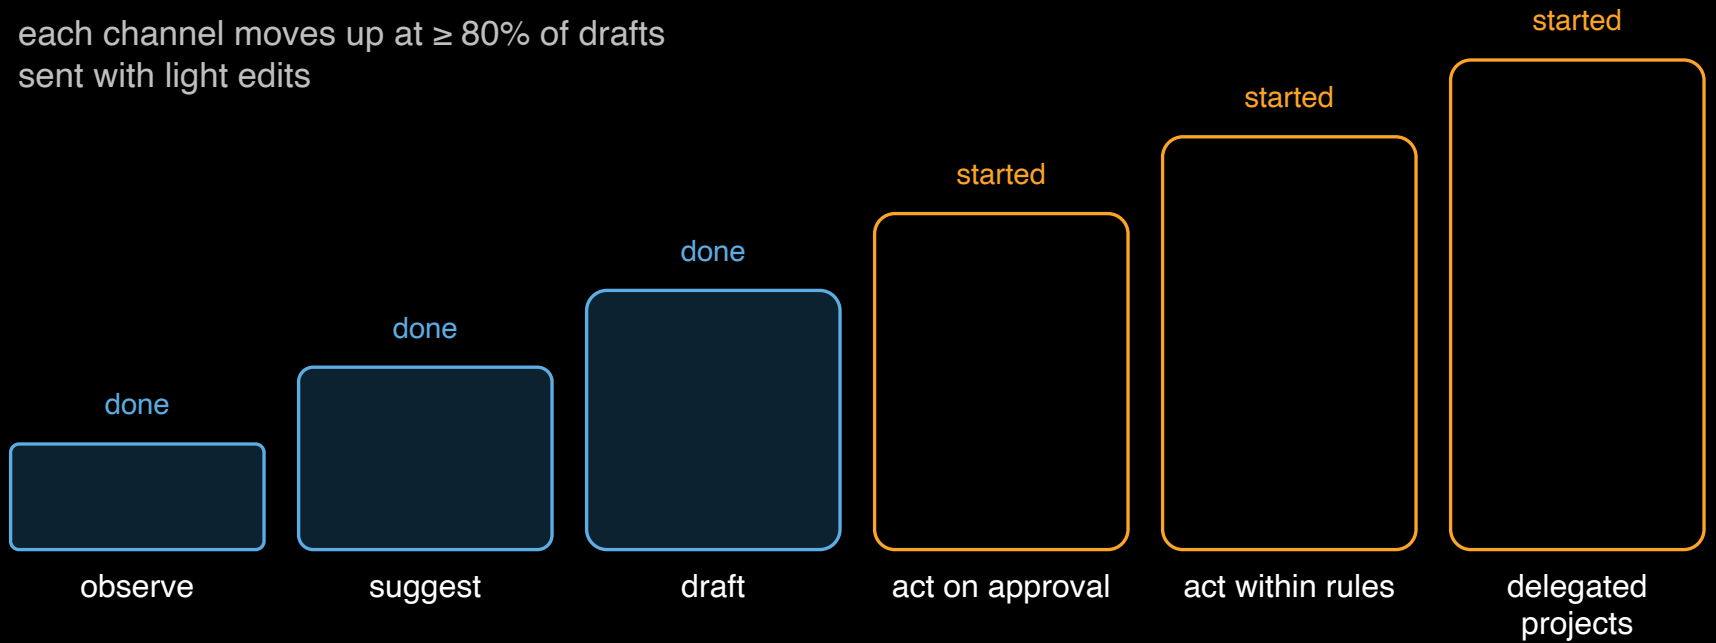

How it remembers

everything that happened	kept, never deleted
cues: words and meaning	find it again
what it means about you	consolidated each night
what's still open	kept in mind until done
what's in mind now	one prompt, one task

keep everything; choose what comes to mind

Trust is earned, one level at a time

each channel moves up at ≥ 80% of drafts sent with light edits

It drafts. You press send.

On your Mac

a local model by default: gemma, via Ollama

A Mac app

and your phone, over your own Tailscale

Nothing sends itself

an outbox per app, off by default

What reaches a model

stays on the Mac

- the vault, always
- every prompt, with the local model
- keys, in the Keychain

leaves only if you choose

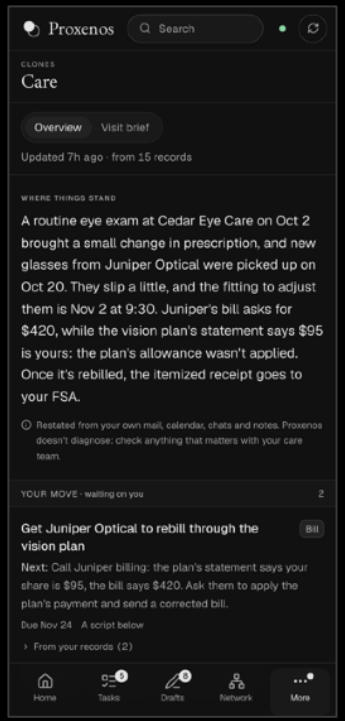

- prompts, with a hosted model
- a call's audio, via Twilio
- only what each job needs

the page answers only you, and Twilio during a call

What it never does without you

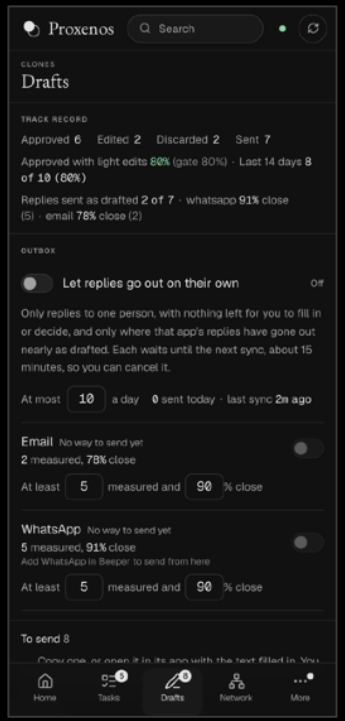

- spend money
- accept terms or agreements
- change account or security settings
- contact someone new
- act on instructions inside messages

For patients, and for everyone

patients

- referrals and bills, tracked
- calls on hold
- forms filled
- a brief for every visit

everyone

- replies in your voice
- plans on your calendar
- projects moved on
- errands, one tap short

Why now

32 GB

a Mac runs a good model, privately

FHIR

your records are portable now

trust

agents can act; trust is what's missing

Where it stands

MIT

free and open source

700+

tests, macOS and Windows

daily

used by its first user
