Proxenos

a personal memory toolbox that drafts your next step

free and open source, for anyone

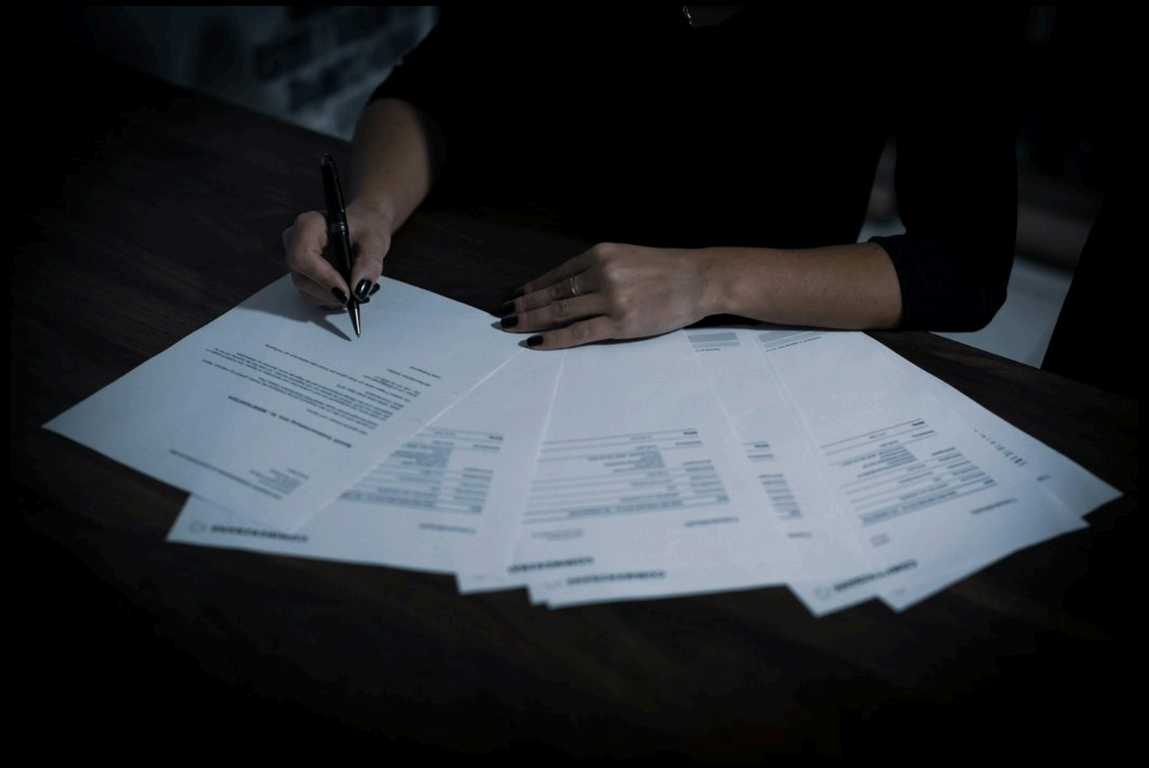

Mrugank Dake

mindemory.io/proxenos

You get sick.

The care is the easy part.

Then come the calls, bills, forms and referrals.

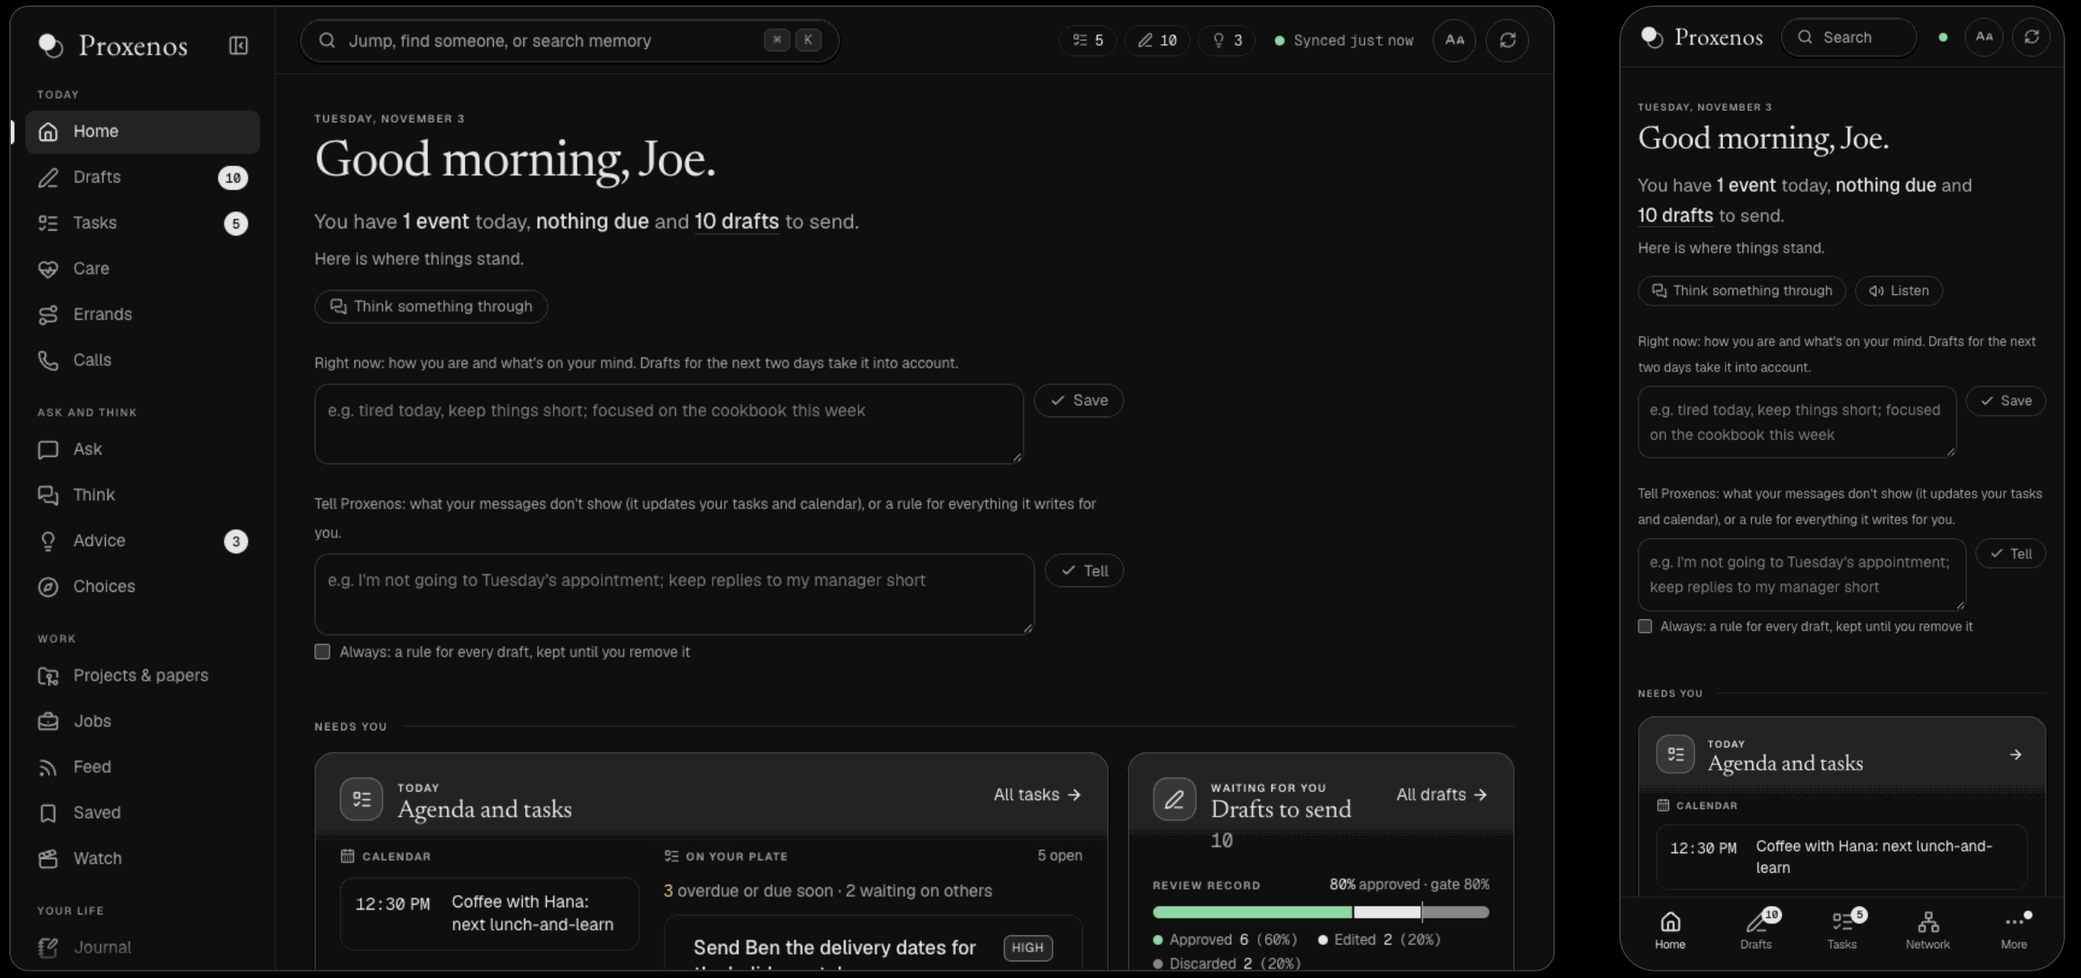

all of it on you, on your worst days

Sick or not,

too many threads, and one of you.

Meet Proxenos

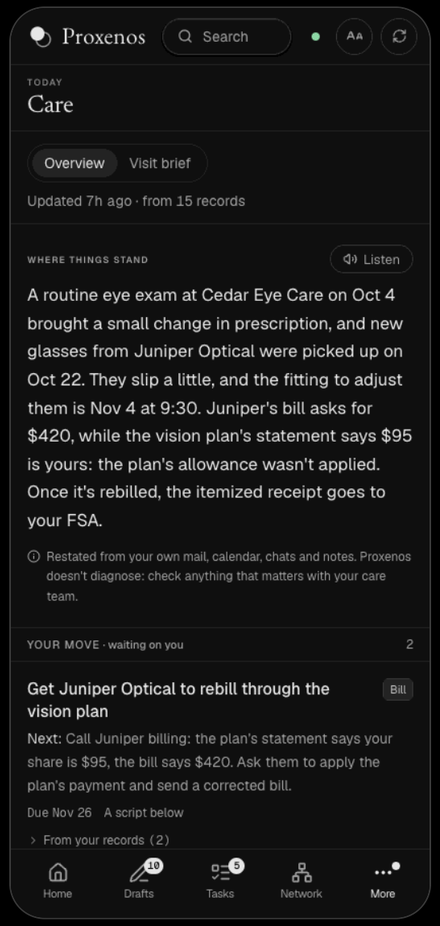

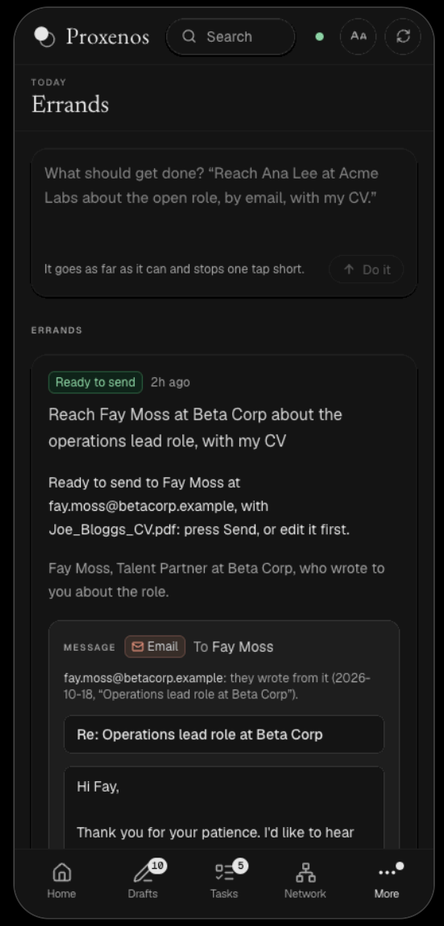

it keeps track, and drafts the next step · you press send

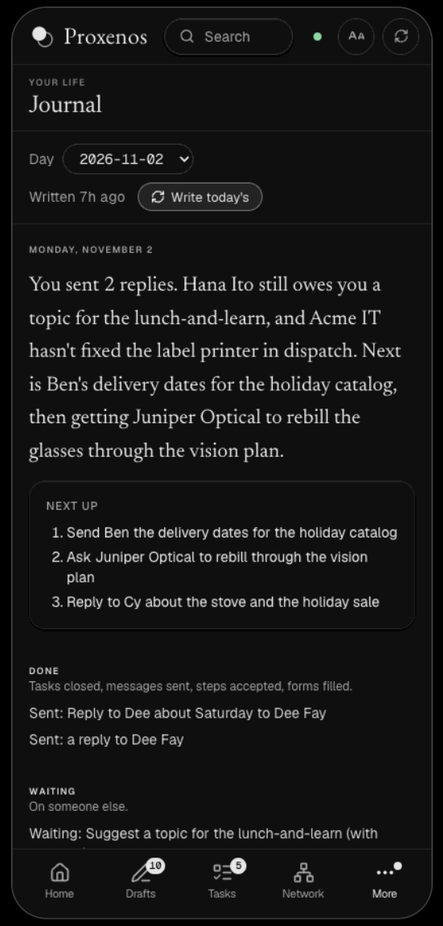

Joe and his records are made up

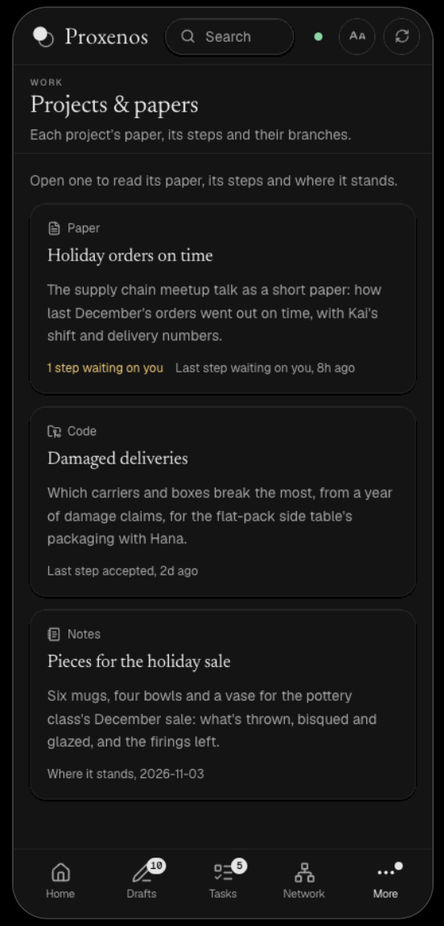

On your phone, too

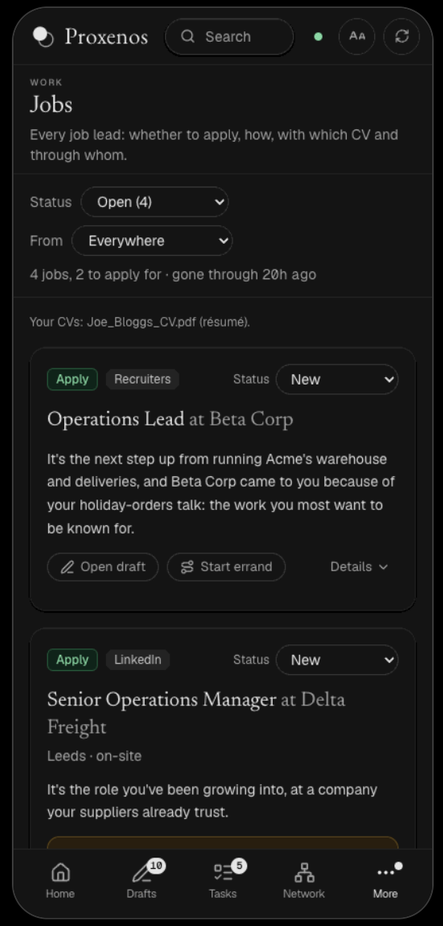

over your own Tailscale · and a notice when something new waits

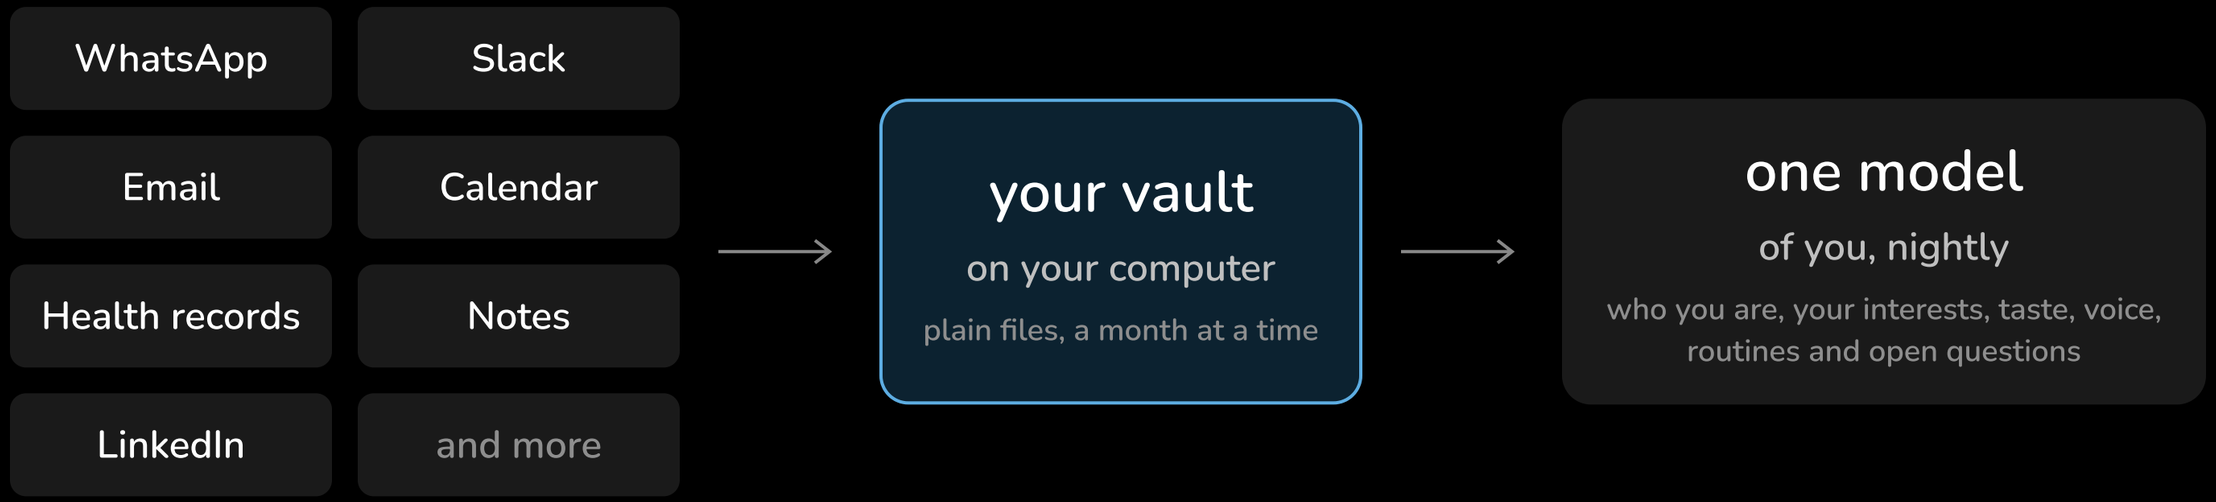

the notice says only how many: never a name or a message's words

Joe and his records are made up

It starts with what you already have

with a model on your computer, nothing has to leave it

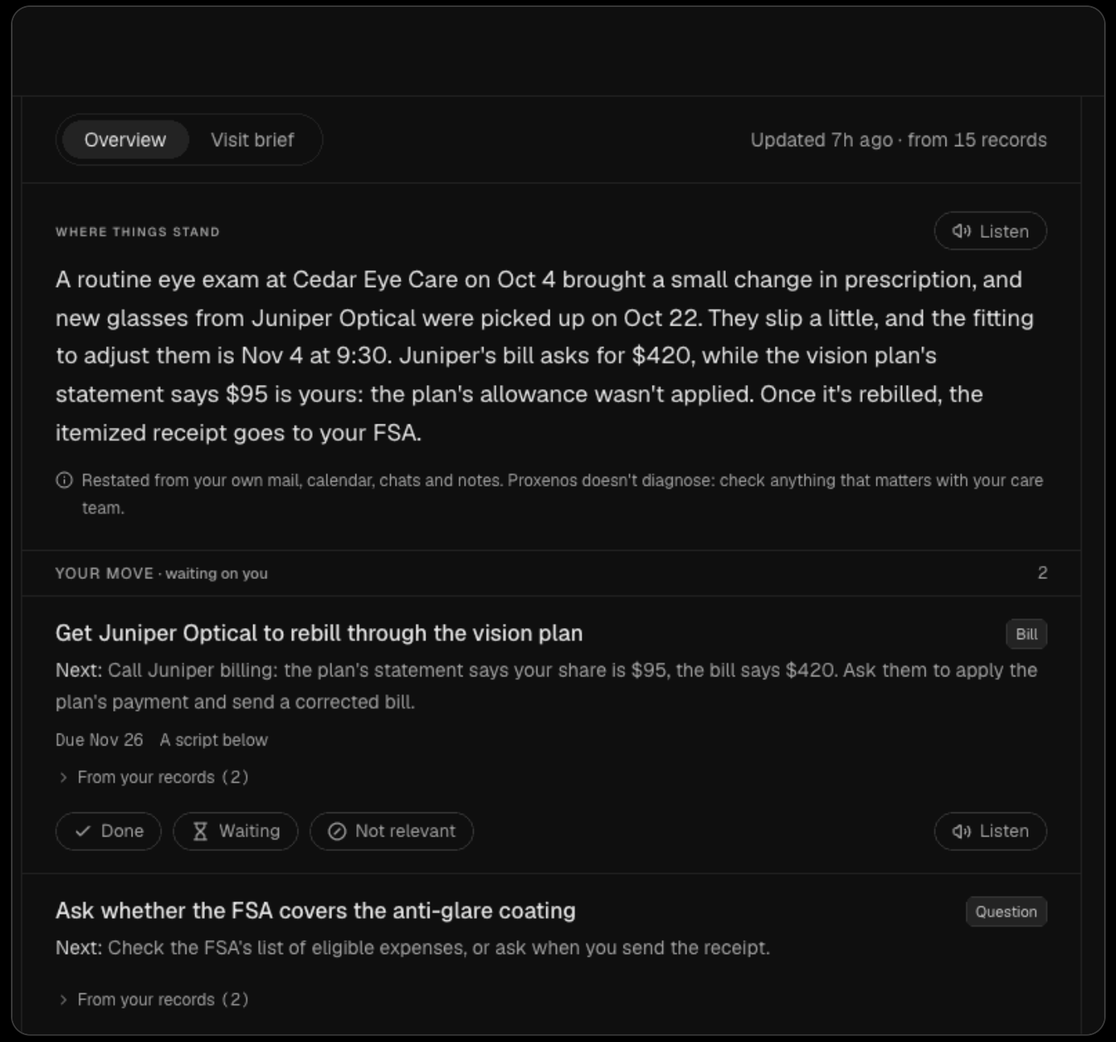

or Claude under your own key: then only what each step needs

What it reads

WhatsApp	Slack	Gmail, any IMAP	Microsoft 365, Outlook
Google Calendar	Apple Mail, Calendar	Health records (FHIR)	Drive, Keep, Tasks
Google Photos	Spotify, live	Strava	LinkedIn, X
Instagram, Facebook, Threads	Chats via Beeper, live	Bluesky	Notion, Obsidian
PDFs, documents	Letterboxd	ChatGPT, Claude	YouTube, Chrome
your site, your papers	Google Docs, for papers	mbox, any mail	and more

about 30 sources · each works on its own · re-running one is always safe

Joe's bill says $420. His plan says $95.

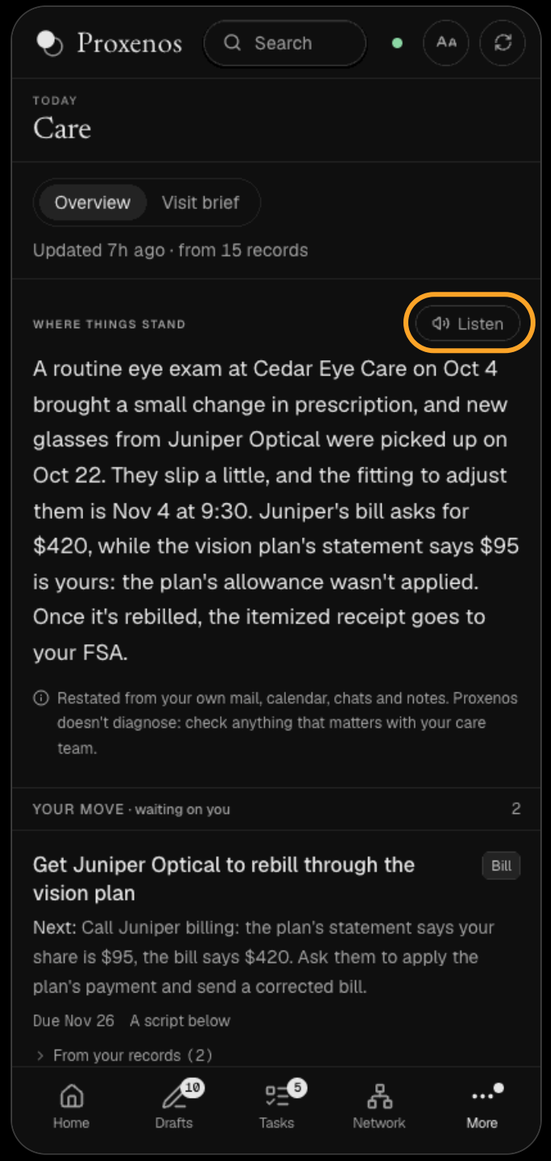

- where things stand
- what's his to do
- what to say on the phone
- a brief for the next visit
- in plain words: each medical term explained

restates his records · never diagnoses

Joe and his records are made up

On a bad day, it reads to him

- Listen: Home's day, Care, and every draft, aloud
- in a natural voice, or his own, made on his Mac
- bigger text, a typeface made for low vision
- more space, a light theme, more contrast, less motion

nothing read aloud leaves the computer

Kokoro for the natural voice, Qwen3-TTS for his own from a short clip, on Apple silicon; anywhere else, the computer's own voice. The typeface is Atkinson Hyperlegible Next, and Aa on every view sets it all.

Joe and his records are made up

So it makes the call

only when he presses Call, from a call sheet on the Calls view

1. **dials**
   through Joe's own Twilio
2. **waits on hold**
   in silence
3. **says what it is**
   an automated assistant
4. **rings Joe**
   when a person answers

or it asks for what the call sheet lists

it never agrees to pay

It fills the form from his records

`intake-form.pdf`

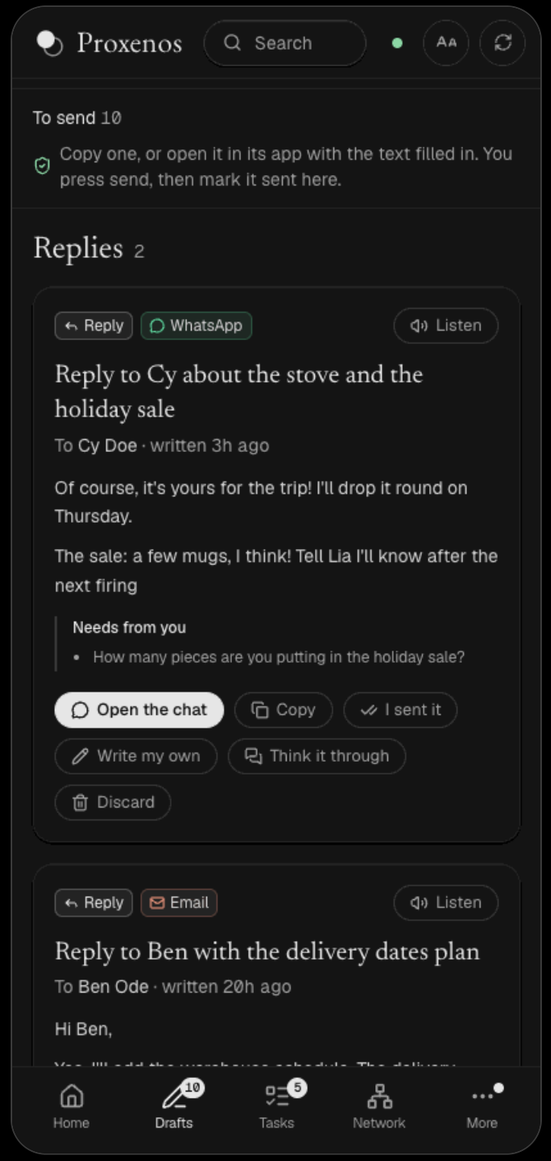

Name	Joe Bloggs	●
Address	14 Birch Lane	●
Date of visit	Oct 4	●
Vision plan	Brightline	●
SSN	left for Joe	○
Member ID	left for Joe	○
Signature	Joe's own	○

- filled from his records
- where each answer came from
- never an ID, an account number or a signature
- only answers his records show

```
proxenos form intake-form.pdf
→ intake-form-filled.pdf, and what's left for him
```

Joe and his records are made up

Every chat waiting on him gets a reply in his voice

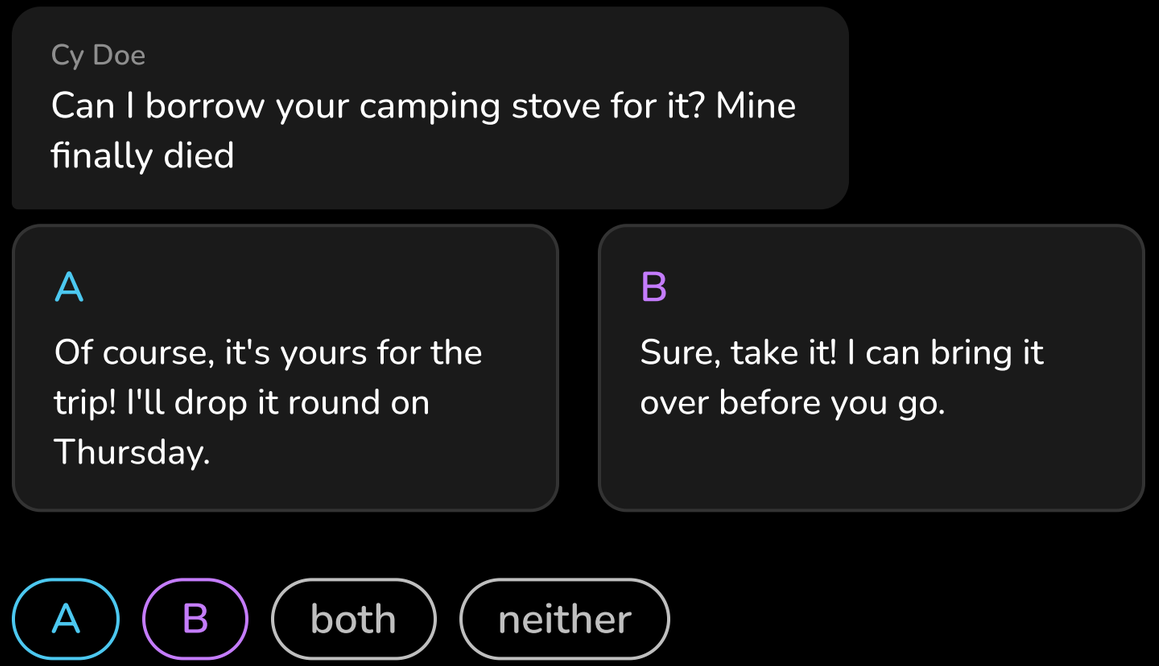

- his voice, per person, after reading any link they sent
- learns from what he sent
- and from what he rewrote: rules he accepts
- a draft made moot since folds away, with why
- a thanks, a receipt or an auto-reply gets no draft

he copies it, or opens the chat with it filled in, and presses send

Which model writes like him? He picks, blind.

- two models redraft his replies in his ten latest chats
- each sees only what came before the reply
- he picks A, B, both or neither, not knowing which
- then: who wrote which, and how close each came to what he sent

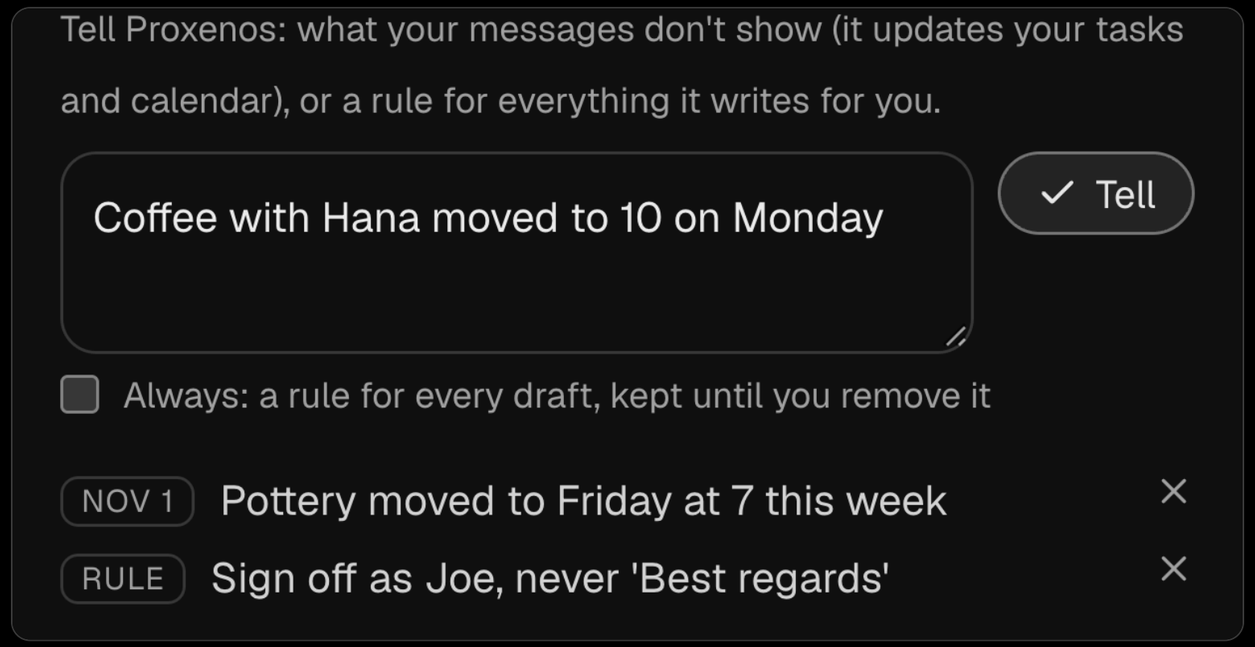

after the pick: which model wrote which, and what he really sent

Settings, "Which writes like you?" · any two models, local or hosted

Joe's chat is made up, and so are both drafts

He tells it what messages don't show

fact — kept two weeks: his tasks and calendar follow

rule — kept until he removes it: every draft keeps it

"I'm not going on Tuesday" · "keep replies to my manager short"

Joe and his records are made up

Plans land on his calendar

WhatsApp

Hana Ito

Coffee Monday at 10? The café on Main St

Joe's calendar

MON 10:00

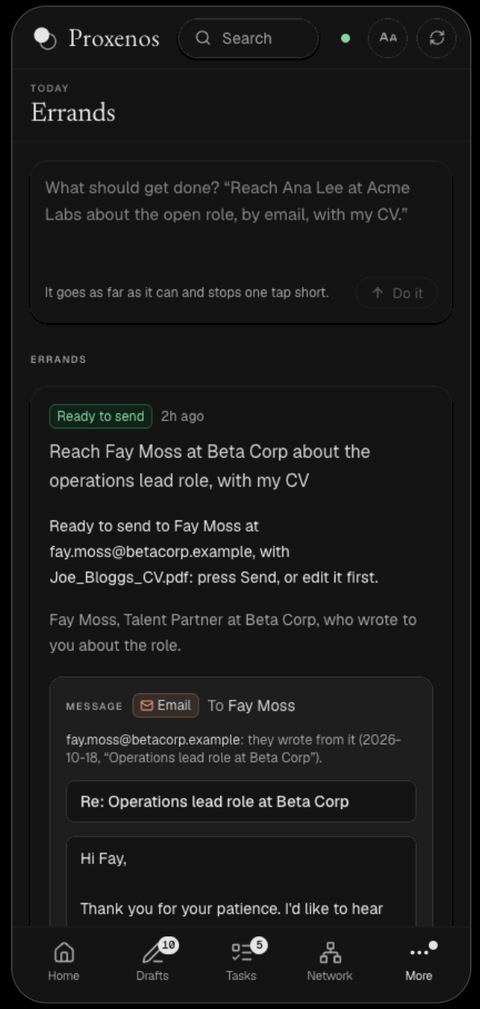

Coffee with Hana

the café on Main St

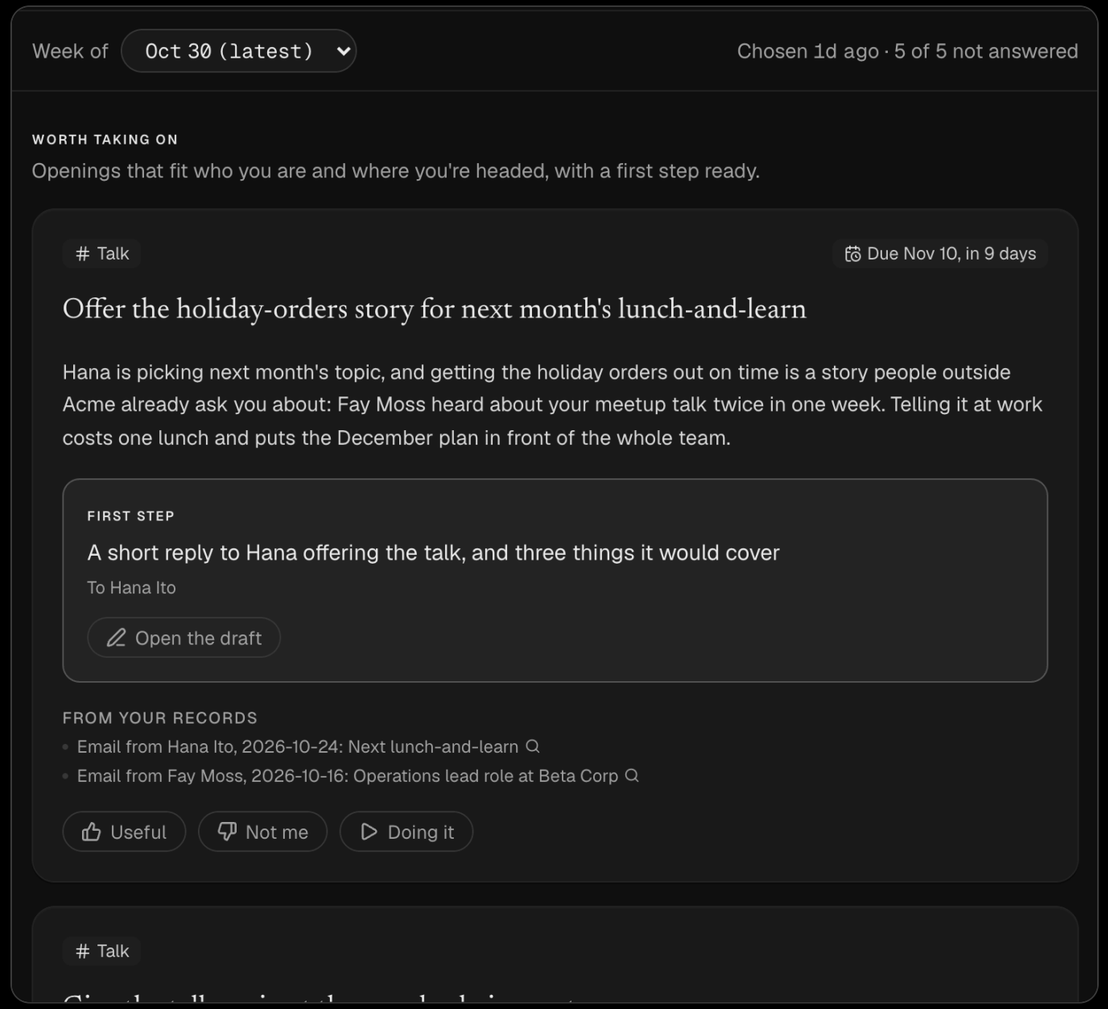

from any chat or email, to his own calendar

taken off when it's called off · only the events Proxenos made are ever changed

It runs his errands, and weighs his week

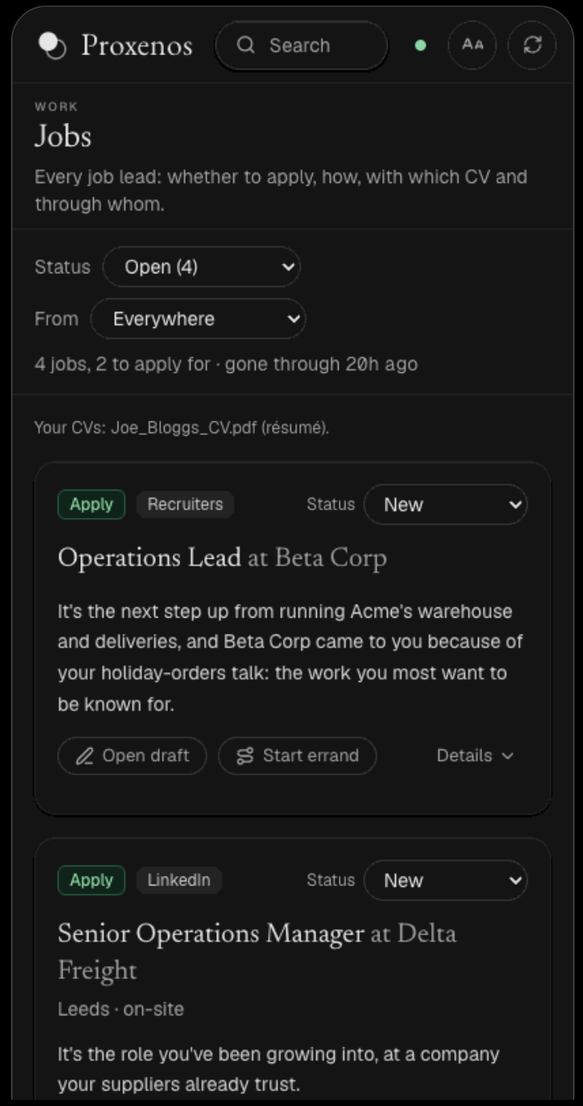

errands: done up to one tap short of send

choices: what to take on and what to let go, each week

Joe and his records are made up

Every job lead, sorted

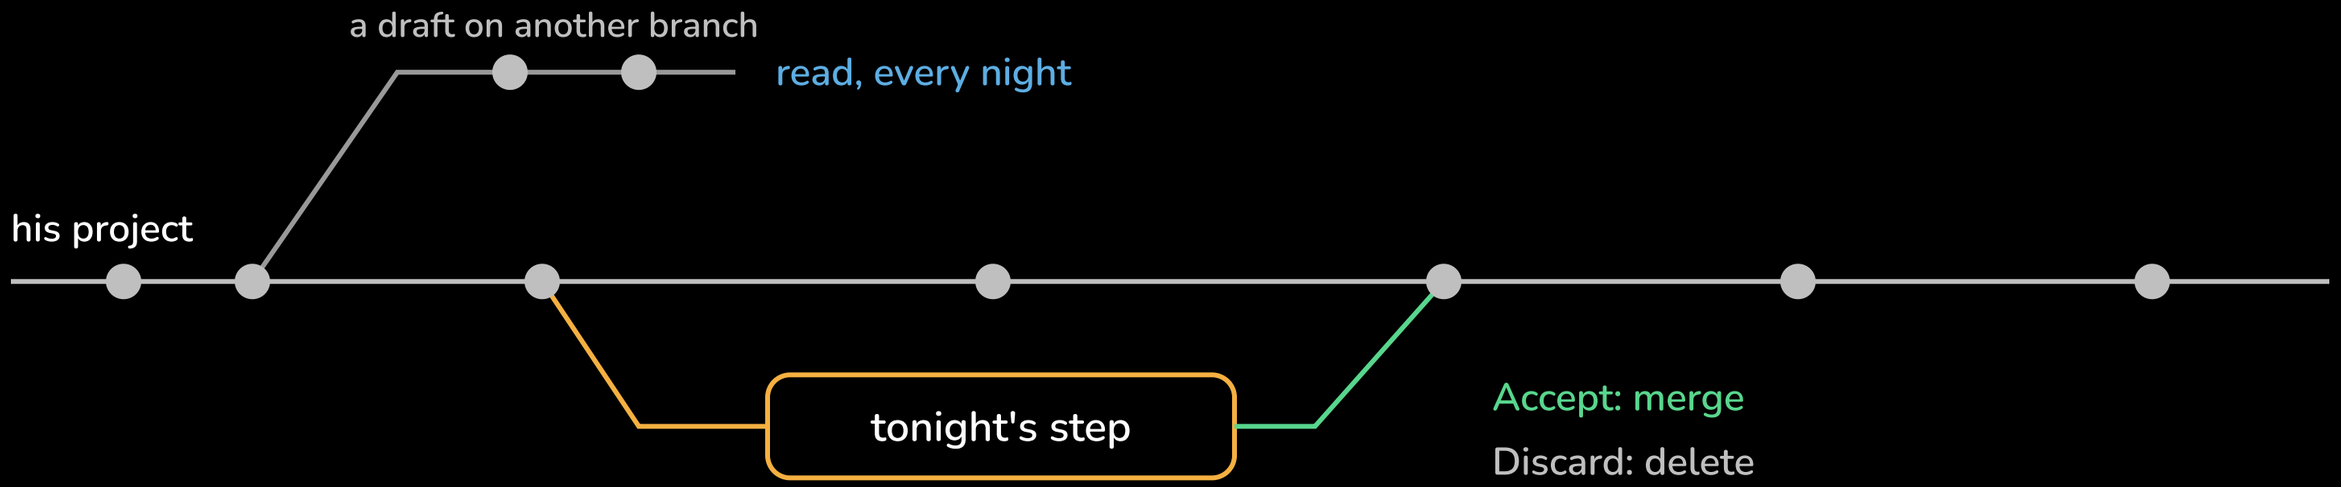

- from LinkedIn, Work at a Startup, recruiters, job boards and Slack, or a post he shares
- apply or not, and why
- the way in, the CV that fits, whom he knows there
- a first step drafted, or an errand to start

his sent mail shows what he's applied to · it drafts, he applies

Joe and his records are made up

His projects move while he sleeps

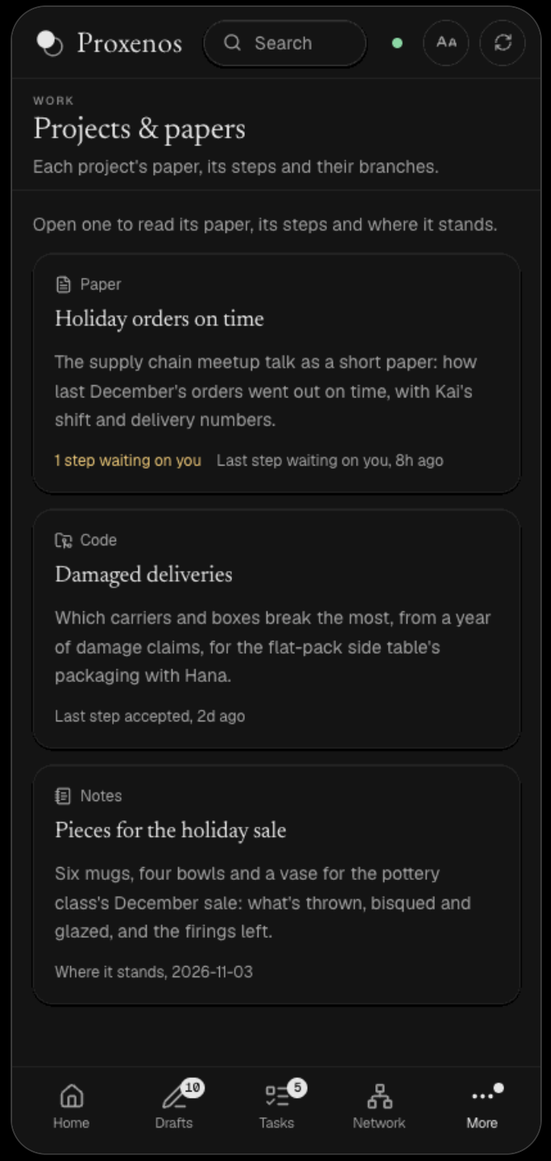

an analysis, a fix, a figure, a section · its own branch · nothing pushed

papers too: every version, and what changed, word by word

by Claude Code where it's installed, else the local model, in a sandbox that can't read his records or keys

His projects and papers

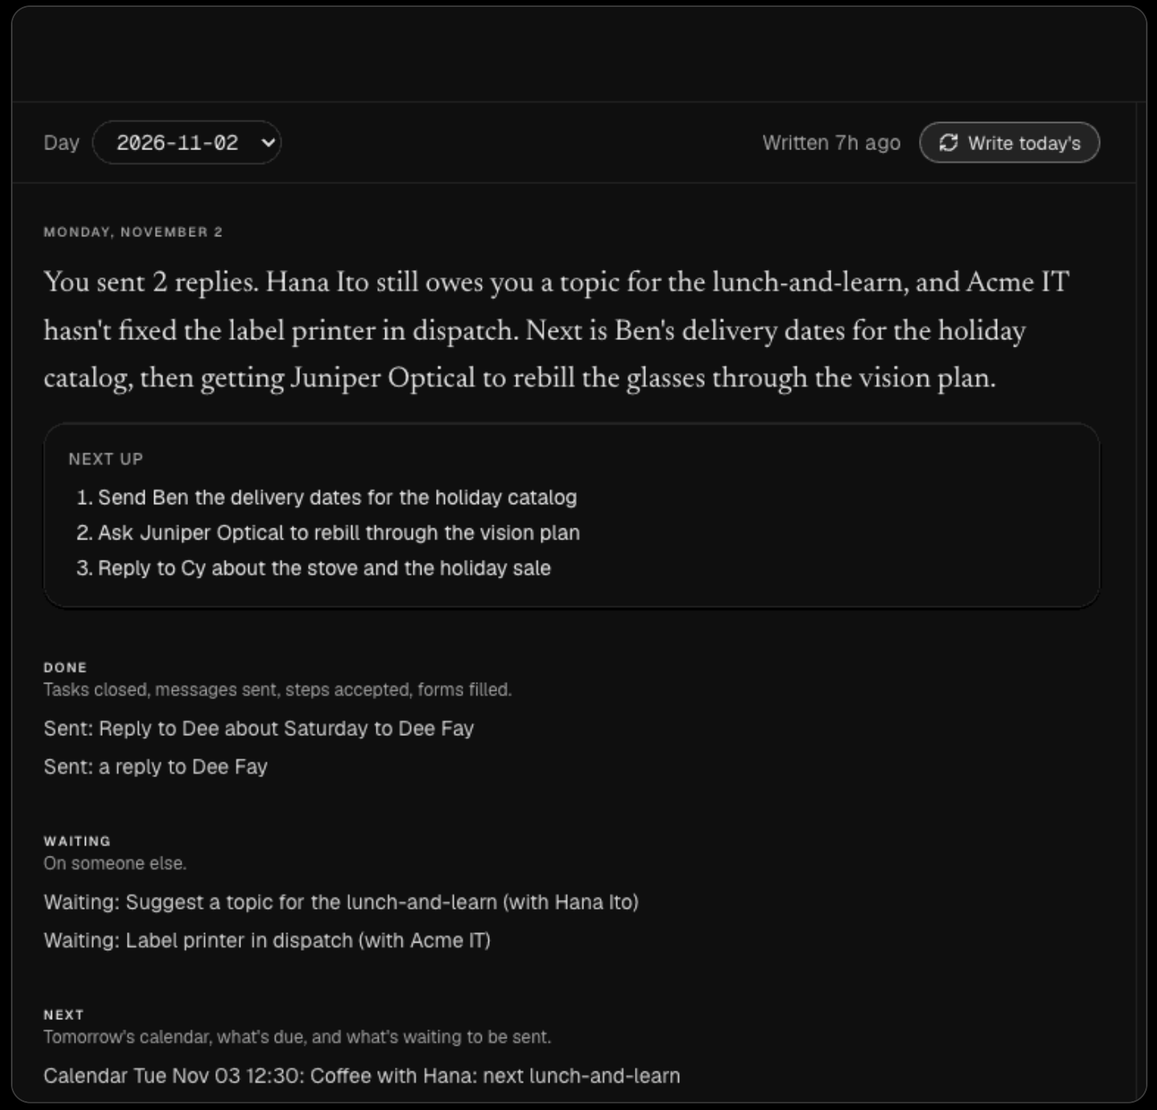

- each one, where it stands, every night
- a paper's versions, and what changed, word by word
- he asks for a change; it comes back on its own branch
- co-authors edit it in Google Docs; their changes come back the same way
- Accept merges it; Discard deletes it

nothing pushed · the Google Doc is in his own Drive, his alone until he shares it

Joe and his records are made up

Each day, written down

- **done**
  tasks closed, steps accepted, forms filled
- **said**
  the chats he wrote in, and the drafts he sent
- **moved**
  what changed in his projects
- **waiting**
  on someone else
- **next**
  tomorrow's calendar, what's due, what's to send

written each night, or when he asks

Joe and his records are made up

His life, a month at a time

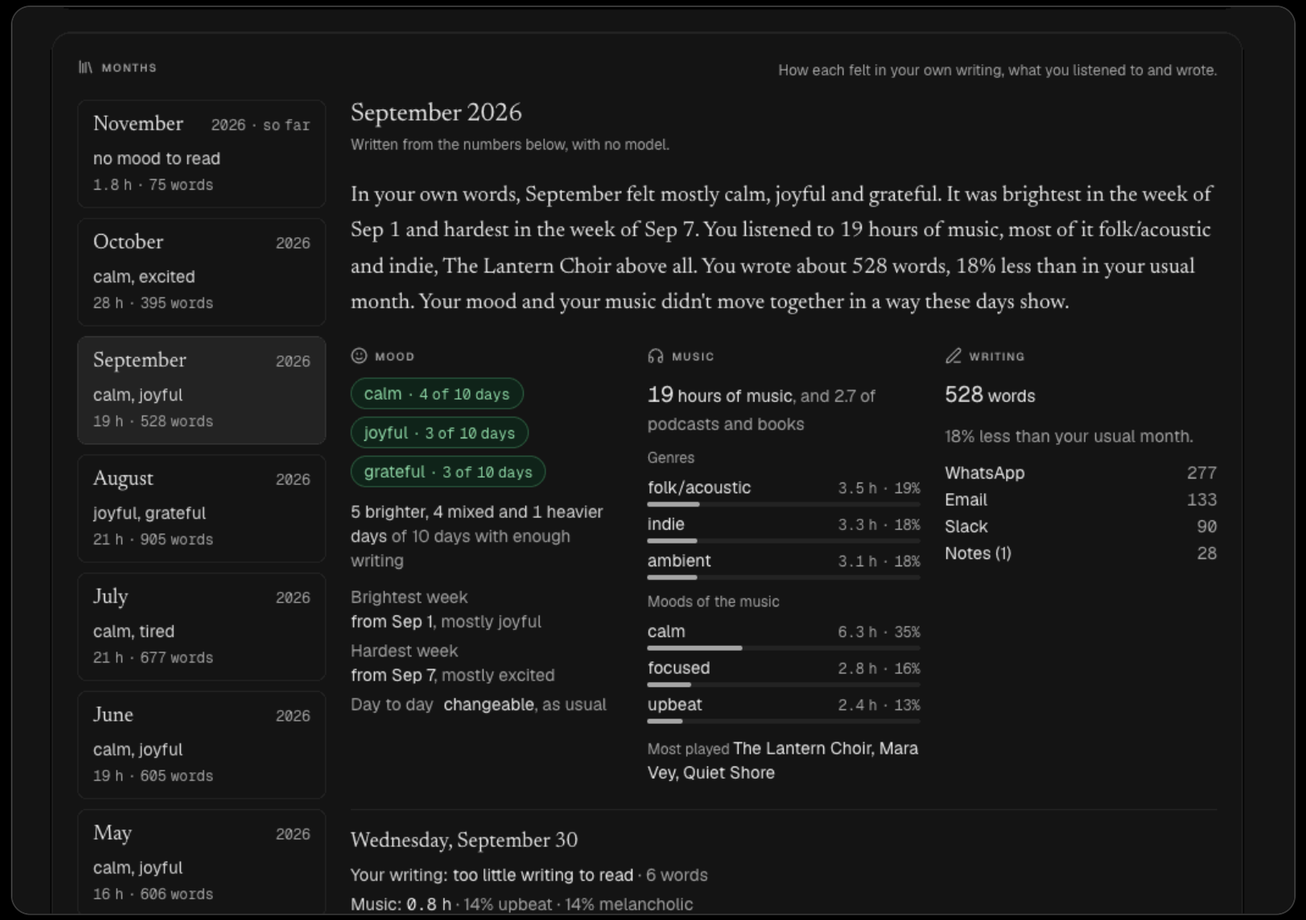

- each month: an abstract, and an essay in his own voice
- an entry for each day that mattered
- from his records, and what he told Proxenos
- his to edit, or mark not true

only what his records and words show · years back, a few months a night

Joe and his records are made up

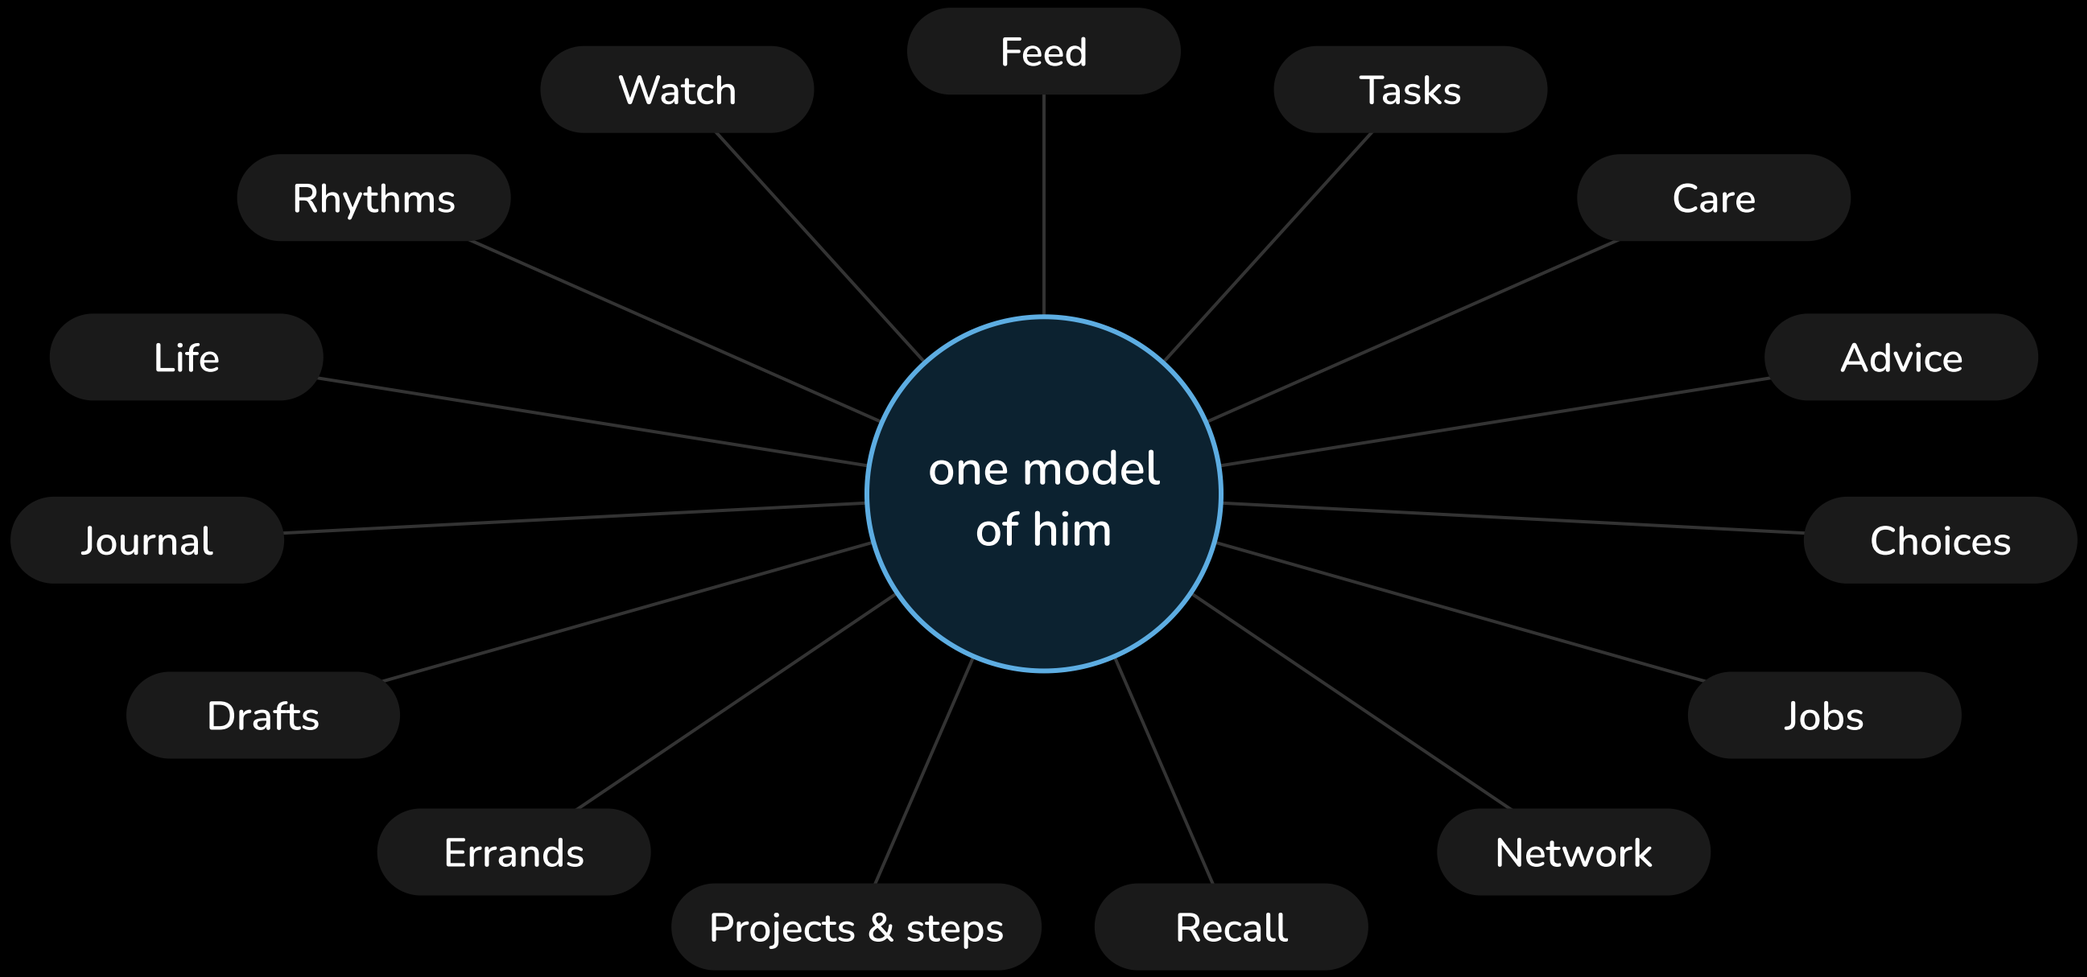

His weeks, side by side

- listening, rides, runs and walks, and messages on each channel
- a week, two weeks or a month at a time
- what stands out, in plain words
- a card for each month: how it felt in his writing, what he played, what he wrote

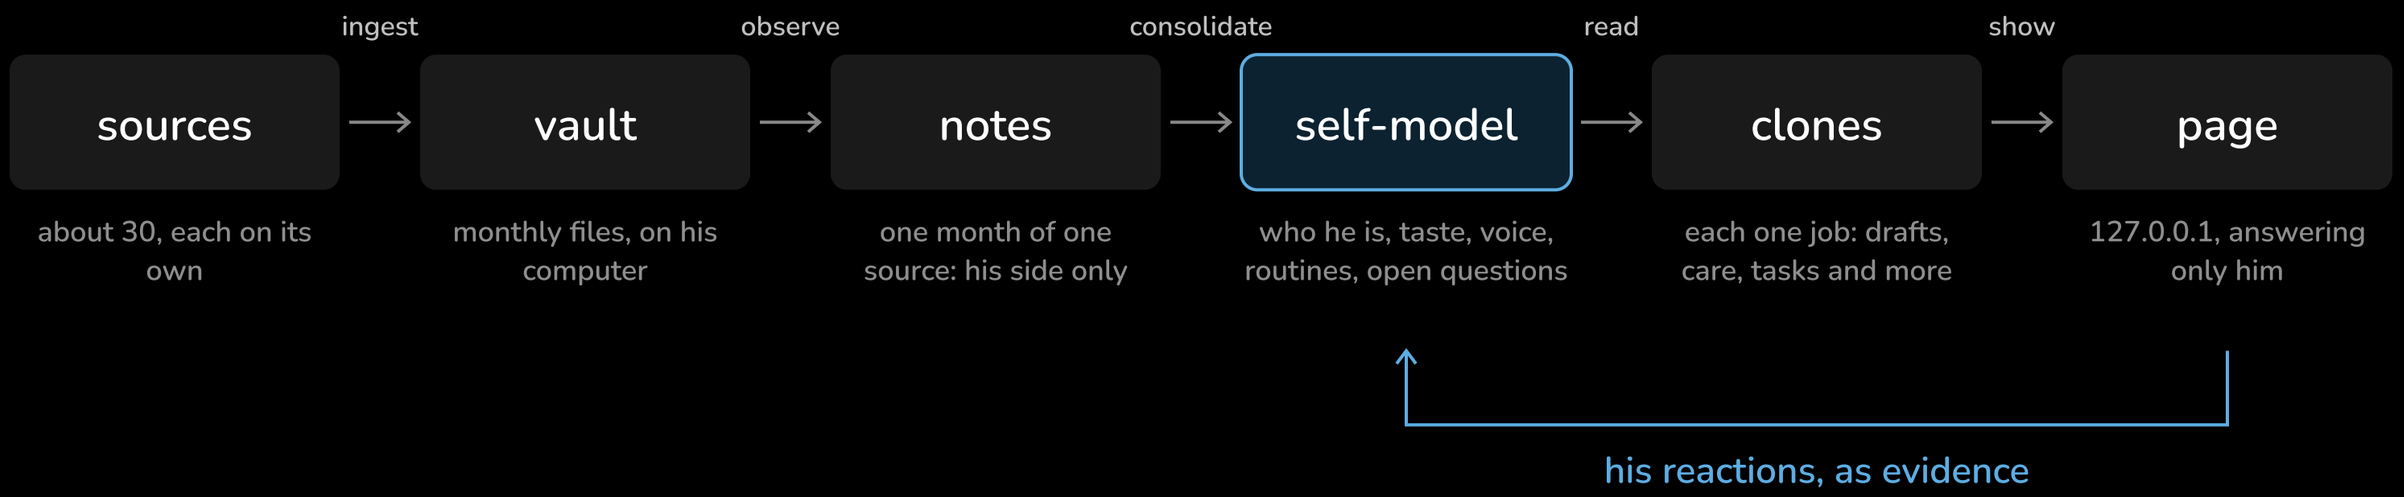

counted with no model · his mood read on the computer, feelings named only by a local model

One model of him, many clones

each clone does one job · only his own behavior counts as evidence

How it works

a sync every 15 minutes · each night at 01:30: notes, self-model, then every clone

the slow-changing parts of the self-model change only through proposals he accepts

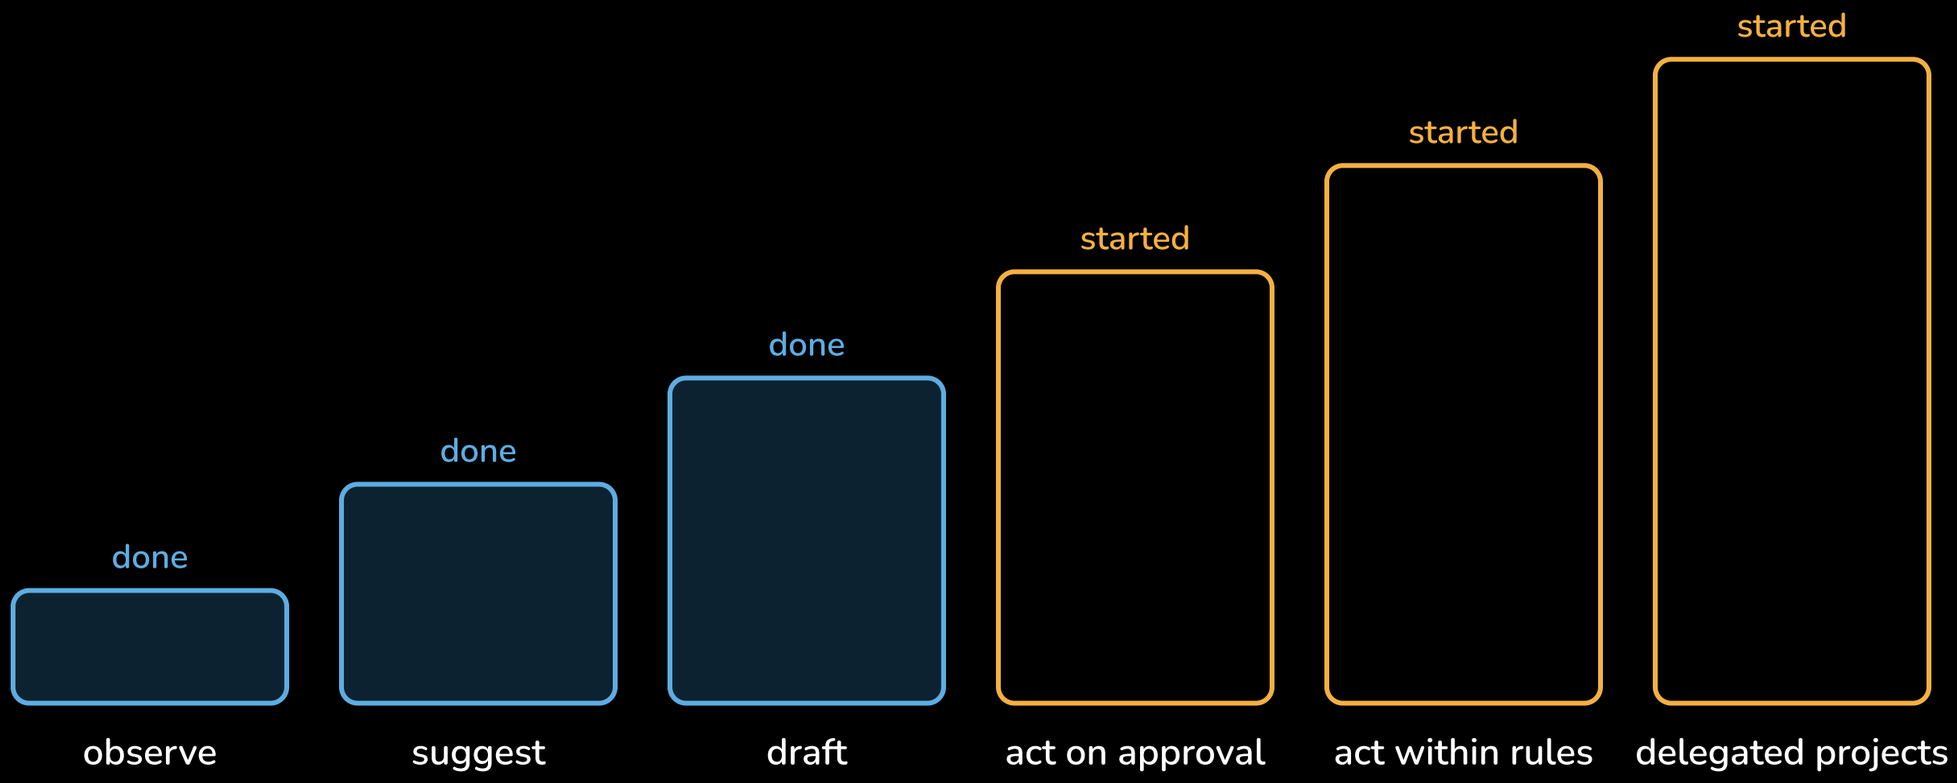

How it remembers

everything that happened	kept, never deleted
cues: words and meaning	find it again
what it means about you	consolidated each night
what's still open	kept in mind until done
what's in mind now	one prompt, one task

keep everything; choose what comes to mind

Trust is earned, one level at a time

a channel moves up a level at 80% of drafts approved with light edits, over two weeks

It drafts. You press send.

On your computer

a model there: gemma via Ollama, or LM Studio, llama.cpp and others

A desktop app

Mac and Windows, unsigned for now · and your phone, over your own Tailscale

Nothing sends itself

an outbox per app, off by default

you copy a draft, or open it in its app with the text filled in, and press send yourself

once your reply shows up in that chat, the draft is marked sent

What reaches a model

stays on the computer

- the vault, always
- every prompt, with a local model
- keys, in the Keychain (or Windows' own store)
- what's read aloud, in any voice

leaves, and when

- prompts, only with a hosted model: card numbers, passwords and keys blanked first
- a call's audio, via Twilio, on a call he starts
- a notice's counts, via ntfy, if he turns it on
- artists' names, to MusicBrainz (one setting turns it off)

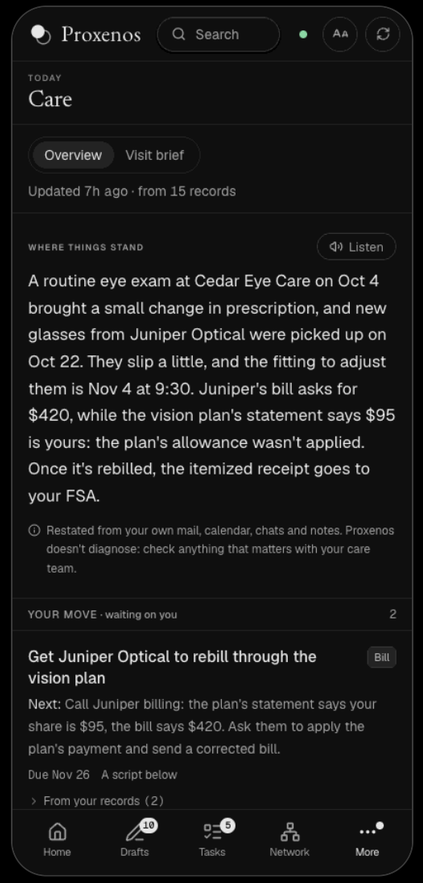

every model call is logged · the Privacy view shows the last 30 days · the page answers only you, and Twilio during a call

What it never does without you

- spend money
- accept terms or agreements
- change account or security settings
- contact someone new
- act on instructions inside messages

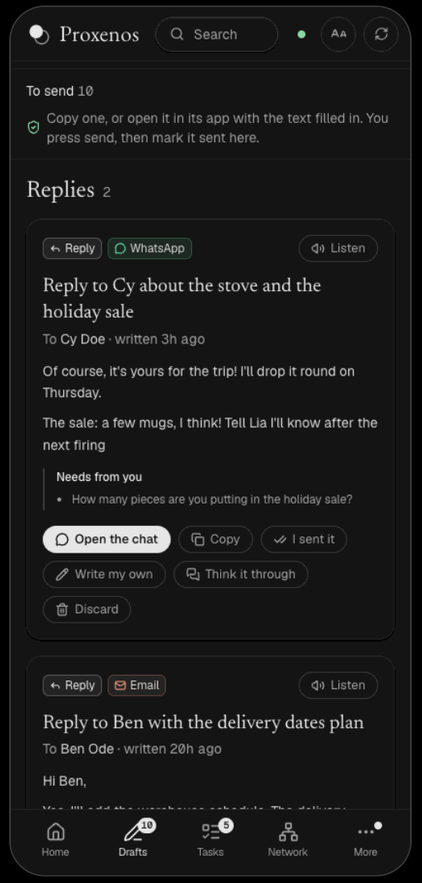

by default it never sends, posts or buys anything by itself

For patients, and for everyone

patients

- referrals and bills, tracked
- calls on hold
- forms filled
- a brief for every visit
- easier to read, and to hear

everyone

- replies in your voice
- plans on your calendar
- projects moved on
- errands, one tap short
- a diary of your life, by month
- your weeks, side by side
- job leads, sorted

Joe and his records are made up

Why now

32 GB

a Mac runs a good model, privately

gemma4:26b, about 17 GB, writes about 23 tokens a second on an M1 Pro

FHIR

your records are portable now

from Apple Health, or a patient portal's download

trust

agents can act; trust is what's missing

so it keeps to your computer, and drafts first

How Proxenos compares

	DATA LIVES	READS	ACTS OR DRAFTS	MODEL OF YOU	CHECKS IT'S LIKE YOU	LICENCE
Proxenos	your computer, plain files	mail, chats, calendars, notes, documents, health records, activity: about 30 sources	drafts; you press send	a written self-model you read and correct	yes: drafts against what you sent; blind picks between models	MIT
Odysseus	your machine	files you add, the web, an IMAP inbox, CalDAV calendars, notes	acts: agents with a shell and MCP; drafts email replies	a memory built from your chats	no	AGPL-3.0
Open WebUI	your server or desktop	documents you upload, the web	acts through tools, agents, MCP	facts about you, if memory is on	no	Open WebUI License
Khoj	your server, or Khoj's cloud	your notes and documents, the web	answers; research on a schedule, by email	long-term memories	no	AGPL-3.0
Screenpipe	your computer	your screen, audio, what you type and click	acts: scheduled "pipes"	no	no	own licence, free for personal use
Mem0, Letta	where a developer runs it, or their cloud	what an app passes it	no: memory for other agents	facts about a user	recall benchmarks, not likeness	Apache-2.0
ChatGPT, Claude	the vendor's cloud	your chats; Gmail, Calendar, Drive once connected	acts: tasks and agents, mostly asking first	saved memories you can edit	no	proprietary
Second Me	your computer	notes and files you give it	answers as you	a model trained on you	partly: a model judged it, on one person's notes	Apache-2.0

only Proxenos does all four at once: your whole record, on your computer · a self-model you can read · drafts in your voice · measured against what you sent

others do more of some things: fuller workspaces, everything on screen, no setup at all · checked against each project's own pages, Nov 3, 2026

New since November 1

Life

a diary of each month, in his voice

Rhythms

his weeks side by side, a card a month

Jobs

every lead, sorted, with a first step

Projects & papers

cards, and each paper's versions

Listen

a natural voice, or his own, made on his Mac

Phone notices

a nudge when something waits, counts only

Which writes like you?

two models, judged blind

A desktop app

Mac and Windows, unsigned for now

also: Think, to talk anything through · a Privacy view of every model call · Aa, for easier reading · a sidebar by what you do there · papers in Google Docs, with co-authors' changes back as a step

Where it stands

MIT

free and open source

1,000+

tests, on macOS and Windows, every push

83,000

lines of Python, TypeScript, Swift and JavaScript

daily

used by its first user

today

- from source on a Mac: one command
- Windows from source: tested, with rough edges
- the desktop app, Mac and Windows: built, unsigned, first release soon

next, for a one-click download

- a signed app: your computer trusts it on first open
- sign in with Google, Microsoft, Slack, Strava and Spotify: no developer accounts
- a small local model in the box

Who's building it

Mrugank Dake

computational neuroscientist

- **Lived the problem**
  weeks on the patient side: calls, referrals, bills
- **Memory researcher**
  PhD, NYU · postdoc, Dartmouth
- **Built like memory**
  keep everything, recall what matters, sleep on it
- **Research to product**
  data science at Meta Reality Labs

Proxenos

It drafts. You press send.
